Quality Standards for Emergency Departments and Hospital-Based Emergency Care Services Toolkit

Get started ▼

Acknowledgement of Country

The Australasian College for Emergency Medicine (ACEM) acknowledges the Wurundjeri people of the Kulin Nation as the Traditional Custodians of the lands upon which our office is located. We pay our respects to ancestors and Elders, past, present and future, for they hold the memories, traditions, culture and hopes of Aboriginal and Torres Strait Islander peoples of Australia.

In recognition that we are a bi-national College, ACEM acknowledges Māori as tangata whenua and Treaty of Waitangi partners in Aotearoa New Zealand.

Acknowledgements and contributors

The Australasian College for Emergency Medicine (ACEM) wishes to acknowledge that funding for this activity has been provided by the Commonwealth as part of the Australian Government Department of Health Specialist Training Program.

Dr Karen McKenna has received Commonwealth funding and ACEM support for this activity as part of the Australian Government Department of Health Specialist Training Program.

Studio Elevenses has also received Commonwealth funding and ACEM support for this activity as part of the Australian Government Department of Health Specialist Training Program.

ACEM would like to thank Dr Karen McKenna for her work in undertaking the review of the Quality Standards content.

A Quality Standards Review Working Group was established to oversee the review of the Quality Standards content. ACEM would like to extend its thanks to the members of this Working Group – FACEMs George Braitberg, André Cromhout, Kimberly Humphrey, Sally McCarthy, Didier Palmer, Niall Small and Anh Tran.

ACEM would also like to thank FACEMs Tim Baker, Trevor Chan, Simon Judkins, Stephen Priestly, Max Raos, Clare Skinner and Andrew Walby for their generous contributions to the Quality Standards Toolkit, as well as ACEM staff James Gray, Robert Lee, Fatima Mehmedbegovic and Jo Tyler.

ACEM also thanks the following College entities for their participation in the review of the Quality Standards:

- Council of Advocacy, Practice and Partnerships
- Indigenous Health Committee
- Manaaki Mana Steering Group
- Quality and Patient Safety Committee
- Reconciliation Action Plan Steering Group
- Regional, Rural and Remote Committee
- Standards and Endorsement Committee

Disclaimer

The Quality Standards and its associated Toolkit have been developed to assist clinicians with implementing the Quality Standards in their own emergency departments (EDs) and other services providing emergency care.

Whilst the Quality Standards and Toolkit are directed to health professionals working within the ED or other hospital settings providing emergency care, who possess relevant qualifications and skills in ascertaining and discharging their professional duties, they should not be regarded as clinical advice. Patients, parents or other community members should not rely on the information in these guidelines as professional medical advice.

The Quality Standards and Toolkit are not intended to provide a substitute for full assessment and consideration of the recommendations contained do not indicate an exclusive course of action or standard of care. They do not replace the need for application of clinical judgment to each individual presentation, nor variations based on locality and facility type.

The Quality Standards and Toolkit are general documents, to be considered having regard to the general circumstances to which they apply at the time of their endorsement. It is the responsibility of the user to have express regard to the particular circumstances of each case, and the application of the Toolkit in each case.

The authors accept no responsibility for any inaccuracies, information perceived as misleading, or the success or failure of any process detailed. The inclusion of links to external websites does not constitute an endorsement of those websites nor the information or services offered.

The Quality Standards and Toolkit have been prepared having regard to the information available at the time of preparation and the user should therefore have regard to any information, research or other material which may have been published or become available subsequently.

Whilst we have endeavoured to ensure that professional documents are as current as possible at the time of their creation, we take no responsibility for matters arising from changed circumstances or information or material which may have become available subsequently.

Introduction

Emergency Departments (EDs) across the world have been experiencing increasing pressure due to growing demand, increasingly complex patients, and limited resources for many years. To address this in an Australian context, in 2011 the Australian Federal Government launched the More doctors and nurses for Emergency Departments initiative.

This initiative aimed to support the training of more emergency doctors and nurses, so hospitals would have the capacity to provide the frontline resources required to ensure adequate supply of the emergency workforce.

Other key aims of this initiative included increased focus on improving the quality of care provided to patients presenting to EDs.

As a result, this initiative gave rise to the development of the Quality Standards for Australian Emergency Departments and other Hospital-Based Emergency Care Services (Quality Standards).

This project was funded by the Australian Government Department of Health through ACEM's National Program Improving Australia's Emergency Medicine Workforce.

The inaugural Quality Standards were developed by a group of healthcare professionals, consumer consultants, writers, and administrators for the purpose of continuous quality improvement within Australian hospital-based emergency care providers.

In 2021, the Quality Standards have undergone a review and been updated as a second edition. The Quality Standards have been extended to refer to Aotearoa New Zealand, and to be more accessible and easier to implement, especially for EDs outside of the metropolitan areas.

Aim

The Quality Standards aim to provide guidance and set expectations for the provision of equitable, safe, and high-quality emergency care in EDs and other hospital-based emergency care services.

The Quality Standards:

- ▶ Encourage a proactive focus on quality and safety.
- ▶ Illustrate the optimal requirements for running a high-quality emergency care service.
- ▶ Offer aspirational criteria for EDs and other hospital-based emergency care services to work towards achieving, thus strengthening the quality improvement culture within EDs.

The Quality Standards were written to address the whole ED process, encompassing the patient experience from presentation to discharge, transfer or admission. With this in mind, all aspects of care and administration within the ED were considered in order to provide a comprehensive account of how an ED or hospital-based emergency care facility should operate.

Scope

One of the complexities of emergency care is that it can be required at any time, by any person presenting with a problem that they consider to be urgent.

The Quality Standards and related objectives and criteria are relevant to any hospital-based service that provides urgent or emergency care to patients, as well as emergency telehealth services.

It is anticipated that within a hospital network, all the requirements of the Quality Standards can be met.

Structure

The Quality Standards were developed to augment the existing ACEM Quality Framework P28.¹

The Quality Standards have a hierarchical structure within which there are domains, standards, objectives, and criteria.

There are five domains which are considered to encompass the priorities of the ED – Clinical Care, Administration, Professionalism, Education and Training, Research.

Each level within the domain provides increasing detail to support EDs in achieving the overall Quality Standard.

Standards	The overall goal wherever possible is outcome-focused and relates directly to the ED. The Standard will always specify the objective that is expected.
Objectives	Measurable elements of service provision. Objectives will usually relate to the desired outcome or performance of team members or services within the department.
Criteria	Components of service provision (inputs) that are required to be in place in order to achieve the objective.

Terminology

Patients

For patients who have capacity to make decisions about their healthcare, the ED team respects the patient's autonomy to choose whether they wish ED staff to involve their family or carers in medical decision-making or care planning. The ED team will involve the appropriate substitute health decision-maker, as determined by jurisdictional law for those who are assessed as lacking the capacity to make decisions about their healthcare.

In all sections of the Quality Standards, where the patient is referred to, it is assumed that the above has been applied and the appropriate persons (patient and/or substitute health decision maker) are involved in discussions and care-planning.

Electronic filing

In the coming years there will be a significant change in healthcare and in emergency medicine to fully integrated information technology systems capable of performing patient administration functions, electronic medical records, e-prescribing, test ordering, follow up, referral and discharge communication, observation recording, alerts and patient follow up.

Some hospitals in Australia already utilise such integrated electronic systems. This document supports the use of electronic systems where possible. In all sections of the Quality Standards, where the patient file is referred to, it applies to both paper and electronic formats.

Emergency department

In all sections of the Quality Standards, where ED is referred to, this includes EDs and hospital-based emergency care services.

The emergency department team

In all sections of the Quality Standards, where the ED team is referred to, it is inclusive of all people working in their respective roles within the ED environment.

What is quality health care

The Institute of Medicine (IOM) described six domains of quality in healthcare:²

Safety	Care provided to patients should not cause unintended harm.
Effectiveness	Care should be based on best scientific evidence. Misuse, overuse, and underuse should be avoided.
Patient-centredness	Care that is respectful of and responsive to individual patient preferences, needs, and values, ensuring that patient values guide all clinical decisions.
Timeliness	Reduce waits and sometimes harmful delays for both those who receive and those who give care.
Equity	Provide care that does not vary in quality because of personal characteristics such as gender, ethnicity, geographic location, and socioeconomic status.
Efficiency	Avoid waste, including waste of equipment, supplies, ideas, and energy.

The Institute of Health Improvement (IHI) Triple Aim Framework complements the IOM domains. It is described as a single aim with three dimensions:³

- 1 The simultaneous pursuit of improving the patient experience of care.
- 2 Improving the health of populations.
- 3 Reducing the per capita cost of healthcare.

The cost of healthcare can be viewed through multiple prisms: the unavoidable requirements to exist within budget constraints, having regard for the impact of the healthcare sector on the environment and on our changing climate, and lastly, the physical and emotional costs borne by the people who make up the workforce.

People are central to these frameworks and to the delivery of healthcare – patients and healthcare workers. The patient is at the centre of the delivery of healthcare, and it is increasingly apparent that the experience and wellbeing of the workforce are important foundations of all aspects of the provision of safe and high-quality healthcare. Recently the IHI Triple Aim Framework has been expanded by many to include a fourth aim, acknowledging the importance of the wellbeing of the workforce in their ability to provide care.

How to use this toolkit

This toolkit has been developed to help users navigate their way through the Quality Standards for Emergency Departments and Hospital-Based Emergency Care Services (Quality Standards) and how they can be applied in everyday ED settings as part of building a safe ED that delivers quality care, and a workplace culture focused on patient and workforce quality and safety.

This toolkit is a living document – it will be continually updated with additional references, resources, case studies and quality improvement scenarios.

ACEM welcomes any feedback on both the Quality Standards and this toolkit.

✉ Please contact policy@acem.org.au with any feedback, or if you would like to provide a case study or quality improvement scenario for inclusion in the toolkit.

Overall structure of the Quality Standards

The Quality Standards were developed to augment the existing ACEM Quality Framework P28.

The Quality Standards have a hierarchical structure within which there are domains, standards, objectives, and criteria.

There are five domains which are considered to encompass the priorities of the ED.

There is also an overarching section on Cultural Safety, which overlays all domains of the Quality Standards.

Each level within the domain expands to provide further details to support EDs in achieving the overall Quality Standard.

Navigating the Quality Standards Toolkit

This toolkit has been developed with three navigation mechanisms. Users are able to navigate their way through components of the Quality Standards that are most relevant to their circumstances via:

- ▶ Domain (including Cultural Safety).
- ▶ By quality improvement scenarios.
 - Patient experience.
 - Mental health.
 - First Nations patients.
 - Geriatric patients.
 - Workforce experience.
 - Disaster preparedness.
 - Education.
- ▶ Resources specific to regional, rural and remote (RRR) settings.
- ▶ Case studies.

Please note: this arrow indicates that the section continues overleaf.
Click to continue reading

How to use this toolkit

Resources to implement the Quality Standards in your ED

Within each Domain, Objective and Criteria a number of additional tools and resources are also included, to assist users with application of the Quality Standards to circumstances within their own ED and/or health service.

If navigating the Quality Standards via Domain, you will find each objective for each Standard across the five domains has:

 An interactive audit tool, allowing you to (i) assess your own ED against each standard and (ii) monitor progress of quality improvement initiatives being undertaken to improve your ED's performance against any of the standards.

 Links to references and additional resources.

 Case studies demonstrating the relevance of objectives and criteria and/or their application to an ED scenario.

You may wish to navigate the Quality Standards using scenarios across the seven quality improvement scenarios:

- | | | |
|-------------------------|-------------------------|--|
| ▶ Patient experience | ▶ Workforce experience | Each of these sections contain a scenario/ scenarios demonstrating the applicability of the Quality Standards. |
| ▶ Mental health | ▶ Disaster preparedness | |
| ▶ First Nations peoples | ▶ Education | |
| ▶ Geriatric patients | | |
| | | |

Short vignettes are also be included and can be found under **Case Studies**.

The section specific to **regional, rural and remote (RRR) settings** contains links to various resources, as well as quality improvement scenarios unique to RRR settings.

Using the audit tool

As part of the Toolkit, each objective contains an **Audit tool** component to assist hospitals with their self-assessment against the criteria set out in the ACEM Quality Standards for Emergency Departments.

Weighting scale – what the colours mean

-  Not applicable
-  ED does not fulfil the standard at all and concerted effort is required to achieve the standard
-  ED partially fulfils this standard, or is unable to prove with documented evidence that it fulfils the standard
-  ED fulfils this standard and can provide evidence of this

A visual of the audit tool is included in this Toolkit. A fillable version of the tool – which allows you to complete the self-assessment – is available for download under each Objective. Click the 'Download the fillable tool' button under the Audit tool tab, save the PDF locally on your computer, and proceed with the self-assessment.

These tools may be updated as the quality standards evolve and develop to better meet the need of EDs.

We want to hear from you!

ACEM welcomes any feedback on both the Quality Standards and this toolkit.

We are also eager to hear from you about your quality improvement journey.

What have you done in your ED that you'd like to share with your peers? Have you implemented a section of the Quality Standards? How did it go?

If you have any other resources you'd like to recommend for inclusion in the Quality Standards, we also welcome these.

 To provide feedback, recommendations or content, please contact us at policy@acem.org.au or +61 3 9320 0444

How to use this toolkit

Reflective Questions

The *Quality Standards* are not intended to be implemented all at once / in one go.

Users are encouraged to reflect on areas of practice within their ED, workforce issues that have arisen and patient concerns, as part of determining what Standards, Objectives and Criteria to focus on.

Some reflections can focus on things that have gone wrong and what can be done differently in order to see improvements. For example:

- ▶ Have there been missed diagnoses?
- ▶ Have there been adverse outcomes?
- ▶ Have there been medication errors?
- ▶ Have there been patient complaints?
- ▶ Are staff experiencing difficulties with procedures?
- ▶ Are staff experiencing difficulties with communication tasks?
- ▶ Are evidence-based clinical interventions being used?
- ▶ Is there any evidence of over-use of resources or provision of low value care?
- ▶ Are diagnostic tests being ordered and followed-up appropriately?
- ▶ Are there barriers to timely and safe admission or transfer of patients?
- ▶ Are ED staff interacting effectively with hospital executive and inpatient teams?
- ▶ Are effective workforce management processes in place?
- ▶ Are some patient groups more vulnerable to error or poor outcomes than others?
- ▶ Do trainees and junior medical officers have access to effective education?
- ▶ Is the departmental quality review meeting (otherwise known as M&M) functioning well?
- ▶ Have any new processes, systems or protocols been introduced that require review?

Users are also encouraged to reflect on positive aspects of the ED's work to identify practices that could be expanded and/or serve as the foundations for additional quality improvement activities. Positive feedback that the ED has received and emergence of new research are other examples that you could use to facilitate a review of existing practices. For example:

- ▶ A well-managed cardiac arrest
- ▶ Debriefing effective team interaction following resuscitation
- ▶ A challenging diagnostic decision
- ▶ A difficult but well performed procedure
- ▶ Effective management of a rare or important condition
- ▶ Learning points from an interesting seminar or conference
- ▶ Thank you letter from a patient or carer
- ▶ Positive feedback from another team or clinician
- ▶ Recognition of achievement such as a team or individual award or scholarship

Cultural safety

With **Equity** as one of its core values, ACEM acknowledges the disparities in health outcomes that occur across communities in Australia and Aotearoa New Zealand and is committed to improving health equity across both countries. ACEM has a particular focus on Aboriginal and Torres Strait Islander and Māori communities, through its commitment to the principles of **Te Tiriti o Waitangi** in Aotearoa New Zealand, the process of **reconciliation** in Australia and the intent of the **United Nations Declaration on the Rights of Indigenous Peoples**.

Key to achieving these health outcomes are healthcare environments that are **culturally safe** and healthcare practitioners that practice in a **culturally safe** manner.

Cultural safety benefits all patients and communities. This may include communities based on indigenous status, age or generation, gender, sexual orientation, socioeconomic status, ethnicity, religious or spiritual belief and disability.

As outlined by both the Australian Health Practitioner Regulation Agency (AHPRA) and the Medical Council of New Zealand, the central tenet of **cultural safety** is improving the quality of care by defining the patient experience.

A **culturally safe** healthcare environment is one of spiritual, social, emotional and physical safety, that does not challenge or attack the individual's identity of who they are and/or what they need.

Cultural safety is determined by Aboriginal and Torres Strait Islander individuals, families and communities. Culturally safe practise is the ongoing critical reflection of health practitioner

knowledge, skills, attitudes, practising behaviours and power differentials in delivering safe, accessible and responsive healthcare free of racism.

Cultural safety therefore overlays all the Standards, Objectives and Criteria outlined in this document.

In addition to all the criteria outlined through the Quality Standards, ACEM recommends that all EDs also incorporate the following recommended actions as part of building a **culturally safe ED** and delivering **culturally safe care**.

Where required, criteria specific to Aboriginal and Torres Strait Islander Peoples and Māori will be specified.

ACEM's Manaaki Mana Steering Group is developing a specific set of standards for ED care in Aotearoa New Zealand, which will facilitate EDs to embody Pae Ora – providing excellent, culturally safe to Māori in an environment where Māori patients, whānau and staff feel valued and where leaders actively seek to eliminate inequity. These standards are due to be finalised in the coming year and will be incorporated into the Quality Standards as a resource, once this has occurred. Users can find further information on Pae Ora Ara Tiatia Manaaki Mana on the College's website [here](#).

Legislation / regulation

The ED team ensure there are appropriate supports in place for patients that contribute to a culturally safe environment.

- Patients have access to support staff such as cultural liaison officers and have the opportunity to discuss plans with others (such as family) before making decisions.
- Service provision is adapted so that it reflects an understanding of the local diversity between and within cultures, including addressing institutional discrimination.
- All staff in the ED provide patient-centred care that includes:
 - ▶ Taking a cultural history with all patients and their families/carers.
 - ▶ Incorporating diverse health beliefs and health priorities into ED care and management plans.
 - ▶ All patients, their family and/or carer having access to support people according to their cultural needs.
 - ▶ All patients being given the opportunity to speak to a cultural and/or religious representative/s of their choosing.
 - ▶ All patients who do not speak English as a first language being provided access to a professional interpreter service and information in their primary language, including for Indigenous language speakers.
- The ED team establishes effective relationships with local primary health care providers that care for Aboriginal and Torres Strait Islander Peoples, Māori and other culturally and linguistically diverse peoples.
- The ED has feedback mechanisms in place for consumer engagement that represents the cultural diversity of the department's patient population (including being available in appropriate languages).
- The ED fosters a work ethic of reflection regarding cultural safety and cultural competency and non-judgemental review of both individual clinician practice and the department's care systems.
- The physical space of the ED is an environment that enhances cultural safety, including the display of Indigenous artwork and culturally relevant posters and health brochures.

Intent

The ED team ensure that the department has appropriate systems, structures and support in place so that staff can provide care in a culturally safe environment.

The implementation of cultural safety frameworks provides the ED team with the ability to engage patients about quality and cultural safety issues.

The importance of patient advocacy for Māori patients

A 54-year-old Māori man presented with haemoptysis and fever via a community provider. He lived in temporary housing out of the area and was hearing impaired. After a previous visit to the hospital with similar problems, he had missed a follow up phone call because he was unable to hear his phone and had no phone credit to return the call.

He had difficulty swallowing, hadn't eaten for five days and, on assessment in the ED, was unable to swallow without coughing. We expedited his outpatient CT thorax scan which revealed a large oesophageal mass that had eroded the trachea, creating a fistula. He was admitted under the surgical service and began treatment in hospital.

Our local Māori Health Team was involved in transport and follow up and, after discussion with the admitting doctor, the surgical team admitted the patient even though he resided outside the area.

It was heartening to see that patient advocacy worked for this patient. He was able to have a diagnosis and treatment, along with holistic support from the Māori Health Team.

There are many reasons why a patient might not return for follow up checks or treatment, and this example highlights the need for individualised and flexible approaches to patient care.

Aboriginal and Torres Strait Islander Peoples and Māori

- The ED team utilises appropriate cultural safety frameworks for Aboriginal and Torres Strait Islander patients, and develops policies, practices and guidelines utilising these frameworks (please refer to Resources section for links).
- The ED team utilises Māori health models to inform clinical practice e.g. the Meihana Model, based on the Māori health framework Te Whare Tapa Wha, to support ED staff to gain a broader understanding of Māori patients' presentations, and guide clinical assessment and treatment/intervention with Māori clients and whānau.

Intent

The ED team ensure that the department has appropriate systems, structures and support in place so that staff can provide care in a culturally safe environment.

The implementation of cultural safety frameworks provides the ED team with the ability to engage patients about quality and cultural safety issues.

- The Australian Commission on Safety and Quality in Health Care (ACSQHC) has described six actions (as part of the National Standards) to assist organisations to improve the quality of care and health outcomes for Aboriginal and Torres Strait Islander people based on the National Safety and Quality Health Service Standards.
The ED team should ensure that the ED's safety and quality priorities align with these actions to address the specific emergency care needs of Aboriginal and Torres Strait Islander people.
- The ED team assess the cultural safety of the department by the systematic monitoring and assessment of inequities (in health workforce and health outcomes). For Australian EDs, please refer to the Australian Institute of Health and Welfare's Cultural Safety Monitoring Framework.
- The ED team receives regular, locally targeted cultural awareness and cultural safety training to meet the needs of its Aboriginal and Torres Strait Islander patients.

Intent

The ED team ensure that the department has appropriate systems, structures and support in place so that staff can provide care in a culturally safe environment.

The reconciliation movement is about recognising and healing the past and committing to a better future – a future in which First Australians are valued, and justice and equity is provided for all. The Reconciliation Action Plan (RAP) program provides a framework for organisations to support the national reconciliation movement. A RAP is a strategic document that supports an organisation's business plan. It includes practical actions that will drive an organisation's contribution to reconciliation both internally and in the communities in which it operates.

The ED has policies, clinical care guidelines and frameworks and other relevant protocols that reflect and/or incorporate their hospital's organisation-wide RAP.

Intent

The ED team ensure that the department has appropriate systems, structures and support in place so that staff can provide care in a culturally safe environment.

Pae ora is the New Zealand Government's vision for Māori health. It provides a platform for Māori to live with good health and wellbeing in an environment that supports a good quality of life.

Pae ora is a holistic concept and includes three interconnected elements:

- ▶ Mauri ora – healthy individuals.
- ▶ Whānau ora – healthy families.
- ▶ Wai ora – healthy environments.

Te Tiriti o Waitangi is New Zealand's founding document and encapsulates the relationship between the Crown and Iwi. Te Tiriti o Waitangi provides a framework for Māori development and wellbeing.

The five principles of Te Tiriti o Waitangi are:

- ▶ **Tino rangatiratanga:** The guarantee of tino rangatiratanga, which provides for Māori self-determination and mana motuhake in the design, delivery, and monitoring of health and disability services.

- ▶ **Equity:** The principle of equity, which requires the Crown to commit to achieving equitable health outcomes for Māori.
- ▶ **Active protection:** The principle of active protection, which requires the Crown to act, to the fullest extent practicable, to achieve equitable health outcomes for Māori. This includes ensuring that it, its agents, and its Treaty partner are well informed on the extent, and nature, of both Māori health outcomes and efforts to achieve Māori health equity.
- ▶ **Options:** The principle of options, which requires the Crown to provide for and properly resource kaupapa Māori health and disability services. Furthermore, the Crown is obliged to ensure that all health and disability services are provided in a culturally appropriate way that recognises and supports the expression of hauora Māori models of care.
- ▶ **Partnership:** The principle of partnership, which requires the Crown and Māori to work in partnership in the governance, design, delivery, and monitoring of health and disability services. Māori must be co-designers, with the Crown, of the primary health system for Māori.

Intent

The ED team ensure that the department has appropriate systems, structures and support in place so that staff can provide care in a culturally safe environment.

- The ED team and/or hospital has policies in place outlining their commitment to the Te Tiriti o Waitangi principles.
- The ED team undertakes regular Te Tiriti training and has an understanding of Te Tiriti obligations.
- The ED team undertakes any research with reference to Pae Ora standards, *Te Ara Tika* and *Kaupapa Māori* research principles.

Tikanga includes Māori beliefs that are inherited values and concepts practised from generation to generation. Values include the importance of te reo (language), whenua (land), and in particular whānau (family and extended family group).

- The ED staff has an understanding of tikanga and has access to any local tikanga guidelines.
- The ED develops and implements local tikanga guidelines and ED staff receive training in the implementation of these guidelines. This work should be done in partnership with the relevant District Health Board (DHB) Māori Health Team.

Intent

The ED team ensure that the department has appropriate systems, structures and support in place so that staff can provide care in a culturally safe environment.

Domain 1 / Clinical care patient pathway

Intent ▶ This domain focuses on the patient journey through the ED as an episode of acute care within the patient's life, from first contact with the ED to admission, transfer or discharge.

Access to the ED is available to any individual with symptoms that lead them to believe they have an illness or injury that requires emergency or unscheduled care. The ED team strive to provide high-quality care to all who seek it in a manner that is timely, evidence-based and effective,

culturally safe, physically and psychologically, and involves shared decision-making with the patient, their family and/or carers.

Standard 1.1 Communication and documentation

Objective A	Communication with patients	>
Objective B	Communication with other clinicians	>
Objective C	Documentation	>

Standard 1.2 Pre-hospital care

Objective A	Advice calls	>
Objective B	Alternatives to ED presentation	>
Objective C	Notifications	>

Standard 1.3 Arrival

Objective A	Triage	>
Objective B	Registration	>
Objective C	Waiting for definitive care	>

Standard 1.4 Assessment

Objective A	Introductions between patient and health professionals	>
Objective B	Vital signs	>
Objective C	History taking	>
Objective D	Examination	>
Objective E	Investigations	>
Objective F	Development and communication of provisional or working diagnosis	>

Standard 1.5 Development of care plan

Objective A	Shared decision-making approach	>
Objective B	Access to consultation with senior staff	>
Objective C	Referral for ongoing care or opinion	>
Objective D	High-risk clinical conditions	>
Objective E	Clinical care standards	>

The ED team ensures effective communication practices occur with the patient in order to keep the patient informed, engaged and central to their assessment and treatment.

- The ED team ensures that communication with the patient is consistent, effective, and accurate. Active listening is utilised.
- The ED team is trained to communicate using the suitable level of language and terminology for the patient.
- The ED team ensures that communication is culturally appropriate. The ED team is aware that different priorities and previous experiences may impact on the patient's sense of safety and engagement.
- The ED team has access to professional healthcare interpreters and cultural safety liaison officers, and utilises their assistance in preference to relying on the patient's family members.
- The ED team has access to consumer advocates, if requested by the patient.
- The ED team ensures the patient is introduced to other clinicians involved in their care.
- The ED team ensures that for patients with intellectual disabilities or incapacity of other causes, immediate contact is attempted with the person's family, carer, or guardian.

Intent

ED team members ensure that there is effective communication between themselves and the patient, within the ED team and with other healthcare providers.

The importance of patient advocacy for Māori patients

A 54-year-old Māori man presented with haemoptysis and fever via a community provider. He lived in temporary housing out of the area and was hearing impaired. After a previous visit to the hospital with similar problems, he had missed a follow up phone call because he was unable to hear his phone and had no phone credit to return the call.

He had difficulty swallowing, hadn't eaten for five days and, on assessment in the ED, was unable to swallow without coughing. We expedited his outpatient CT thorax scan which revealed a large oesophageal mass that had eroded the trachea, creating a fistula. He was admitted under the surgical service and began treatment in hospital.

Our local Māori Health Team was involved in transport and follow up and, after discussion with the admitting doctor, the surgical team admitted the patient even though he resided outside the area.

It was heartening to see that patient advocacy worked for this patient. He was able to have a diagnosis and treatment, along with holistic support from the Māori Health Team.

There are many reasons why a patient might not return for follow up checks or treatment, and this example highlights the need for individualised and flexible approaches to patient care.

The ED team ensures that communication with other clinicians, such as allied health or other specialty medical consultants is effective.

- The ED team has a process to ascertain whether the patient wants their primary care provider to be informed about their ED presentation.
- The ED team has a mechanism in place to inform the relevant primary care provider about a patient's episode of care in the ED on every occasion of service.
- The ED team has a mechanism in place to obtain information from the primary care provider that is relevant to a patient's admission to hospital via the ED.
- The ED team has consistent communication practices with other care providers, including a mechanism for referral of patients presenting to the ED out-of-hours.
- The ED team ensures that sufficient information is recorded regarding patient assessment, diagnosis, treatment and suggested follow up to enable timely access to information by other care providers.
- Standardised communication tools and formats are available to the ED team.

Intent

ED team members ensure that there is effective communication between themselves and the patient, within the ED team and with other healthcare providers.

Ensuring good communication with GPs and other health professionals

Discharge letters are important for continuity of care and following up test results. But many GPs had complained that discharge letters from the ED were not sent directly to them. Other feedback suggested these letters were often of poor quality and did not clearly explain what the ED was asking the GP to review or follow up.

The ED's management of discharge letters for GPs was also inconsistent, with some doctors giving letters to patients, while others faxed or posted them to GPs. There was also no way of checking how or when a discharge letter may have been sent to a GP.

Our approach was to develop a standardised discharge letter template using SBAR (situation, background, assessment and recommendation). The template was made available across EMR for use. We also introduced the use of a secure web transfer portal that enabled ED staff to send emails directly to GPs and check that a discharge letter had been sent.

This improved the quality of discharge letters, and resulted in more of these letters reaching GPs. It was also easier to confirm that a discharge letter had been sent.

However, there are still ongoing challenges including compliance with the use of the recommended SBAR format and the fact that patients often change GPs and this is not always updated in EMR.

Having a consistent electronic process improves compliance and auditing – although it also requires giving instructions to large numbers of rotating junior medical officers which is time consuming.

GPs themselves are also important stakeholders in developing this process, both in relation to the quality and key elements of a discharge letter and to how it is transmitted.

The ED team documents and maintains all aspects of the patient visit to ensure that complete records are available to other healthcare providers.

Criteria for electronic health records

- Initial findings and subsequent interactions are accurately documented in patient files.
- The ED team ensures that there is a consistent system which guarantees each responsible clinician has completed an entry in the patient file.
- The ED team ensures that entries are recorded at the time of review, consultation, or treatment.

Supplemental criteria for paper-based files

- The ED team ensures that the patient file is maintained with each page identified with the patient's unique identifier and name.
- The ED team ensures that entries are clear and legible, with correct spelling, date, and time.
- Each member of the ED team annotates or signs where they have made notes in the patient file and there is a designation and contact number, or pager number recorded where practicable.

Intent

ED team members ensure that there is effective communication between themselves and the patient, within the ED team and with other healthcare providers.

Advice given by telephone does not constitute a full assessment and emergency staff should err on the side of caution.

- The ED team seeks to divert telephone advice calls from the general public to an appropriately staffed and resourced medical advice service, including virtual care or telehealth services where available. Where this is not possible, telephone consultation should include first aid instruction and the advice to seek further assistance by presenting to a community healthcare provider or nearest ED, or by calling an ambulance.
- ED teams in rural and remote areas have locally agreed upon processes for managing advice calls in line with relevant ACEM policies that are suitable for the local community.

Intent

The ED team has a system for receiving, recording, and sharing relevant information exchanged with other care providers prior to the patient's arrival at the ED. Advice calls from the general public are handled appropriately.

- The ED team ensures that a senior team member is available to gather information and provide clinical advice prior to the arrival of a patient.
- The ED team has a clear process that ensures ambulance, General Practitioners (GPs), surrounding hospitals and other nearby health facilities can accurately transfer patient information to the ED.
- The ED team ensures that calls to a designated notification system are answered in a timely manner.
- The ED team utilises a standard template for recording pre-arrival information.
- Where deemed necessary, advance notification of a potential need for clinical support by other hospital units for high-risk or high acuity patients should be undertaken (e.g. airway support from anaesthesia).
- Where necessary, the ED team can make special preparations for the arrival of the patient including identifying any need for decontamination, isolation, Personal Protective Equipment (PPE), and/or resuscitation preparation.

Intent

The ED team has a system for receiving, recording, and sharing relevant information exchanged with other care providers prior to the patient's arrival at the ED. Advice calls from the general public are handled appropriately.

Patients who present to the ED are allocated an assessment priority that aligns with the ATS.

- The triage area is immediately accessible and clearly signposted.
- The triage area and processes ensure privacy is maintained for patients.
- Patients presenting to the ED are triaged on arrival by a specifically trained and experienced health professional.
- Relevant vital signs are recorded at triage or as soon as is practical.
- The ED team triages patients in compliance with the ATS and utilises relevant tools from the Emergency Triage Education Kit (ETEK).
- Triage assessment and ATS code allocated are recorded in the patient file.
- The triage system is applied in a clear, consistent, and non-discriminatory manner.
- The triage system applies specific conventions for vulnerable patients or situations.

Intent

Patients who present to the ED are allocated an assessment priority that aligns with the Australasian Triage Scale (ATS). Patients are identified using demographic data, relevant medical notes are obtained or linked to.

Patients required to wait for treatment are informed about anticipated waiting times and regularly observed by the ED team. Any clinical deterioration that occurs whilst waiting is identified and acted upon.

Improving the management of patients with transient ischaemic attack in the ED

Our ED had no uniform approach to managing transient ischaemic attack (TIA) patients.

We found that there had been incomplete bedside and imaging investigations in the ED before patients were discharged and there was no guideline-based planning for discharge that included a plan for medication.

We collaborated with both the neurology department and radiology department to develop a TIA pathway that would enhance ED care for TIA patients. We also implemented an ongoing audit of our processes against the pathway.

This new pathway improved the delivery of ED care to TIA patients, and included the following steps:

- ▶ all TIA patients to have OP MRI and echocardiography;
- ▶ all TIA patients to be discharged with a list of medications approved by the neurology department;
- ▶ all TIA patients to be seen by a neurology/stroke team before discharge from the ED.

This improved both patient care and patients' satisfaction with the ED experience.

The process of creating a better plan for TIA patients highlighted the importance of evidence-based care in the ED – i.e. the development of evidence-based guidelines. It also underscored the value of collaborative work between the ED and other specialty departments, and how this collaboration can improve patient care, patient outcomes and a patient's overall hospital experience.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

The patient is accurately identified using demographic data.

Relevant medical notes are obtained or linked to. Recent presentations are flagged.

Systematic processes are utilised to ensure patients whose identity is not known receive suitable identification and record of emergency care.

Patient identification

- The ED team has a process to ensure the collection of demographic information will not impede the provision of timely clinical care.
- The minimum demographic details that are collected at registration for patients comply with jurisdictional requirements.
- The ED team obtains registration information from the patient or their family, carer, community health providers or external agency where required.
- Information gathered for registration may also include ethnicity, language spoken and special communication needs, preferred name, gender as well as sex assigned at birth*, nominated next of kin, primary healthcare provider.
- A patient matching and identification process is implemented using collected demographic data.
- Patients should have an identification band placed on them as soon as is practicable.

Identification of an unknown patient

- There is a clear process for providing a unique identifier to a patient whose identity is unknown.
- There is a clear process for assigning unique identifiers to multiple patients in disaster situations.
- Temporary patient identifiers are linked to the patient's correct identity once established.

Intent

Patients who present to the ED are allocated an assessment priority that aligns with the Australasian Triage Scale (ATS). Patients are identified using demographic data, relevant medical notes are obtained or linked to.

Patients required to wait for treatment are informed about anticipated waiting times and regularly observed by the ED team. Any clinical deterioration that occurs whilst waiting is identified and acted upon.

Obtaining medical notes

- There is an effective and efficient system for obtaining patient files in a timely manner.
- Clinical alerts recorded within patient files are flagged.
- The ED team has access to patient files stored offsite or on other digital platforms.

Flagging of recent presentations

- Multiple presentations to healthcare providers over a short time period as a sign of risk of potential deterioration is recognised.
- There are mechanisms for flagging recent presentations of the same patient, and ensuring they are reviewed by senior staff.

Preservation of privacy and anonymity

- Patient privacy is preserved.
- There is a process to allow for anonymity for certain patients, such as fellow ED team members.

Intent

Patients who present to the ED are allocated an assessment priority that aligns with the Australasian Triage Scale (ATS). Patients are identified using demographic data, relevant medical notes are obtained or linked to.

Patients required to wait for treatment are informed about anticipated waiting times and regularly observed by the ED team. Any clinical deterioration that occurs whilst waiting is identified and acted upon.

Reducing lengths of stay for high-dependency patients in the ED

Our high-dependency unit (HDU) patients were experiencing prolonged lengths of stay (LOS) in the ED, ranging from five to 15 hours.

To tackle the problem we developed the ED-HDU Project. This was a collaboration between the ED and ICU, with support from the hospital's Continuous Improvement Department, and aiming to reduce the LOS for these patients to under six hours.

The ED-HDU project involved:

- ▶ Root cause analysis – this included breaking the HDU patient journey into steps with attributable problems.
- ▶ Extensive staff surveys on the issue.
- ▶ Identifying the top three barriers contributing to prolonged LOS. These were: (i) no defined referral or admission criteria (ii) problems with medical rostering/workload and (iii) lack of clarity about what level of management in-patient wards could provide.

This process led to the following corrective measures:

- ▶ Standardising the referral and handover process.
- ▶ Defining the clinical triggers for referral.
- ▶ Defining the involvement of senior medical staff.
- ▶ Defining the escalation process.
- ▶ Implementing and introducing flow charts.
- ▶ Ongoing checking of results.

The project improved collaboration and communication between the ED and ICU, and eventually reduced the LOS of HDU patients (although there was an initial worsening of the LOS at the start of the project when the LOS increased to 8.08 hours). However, we ultimately reduced LOS for these patients by over an hour to 4.85 hours.

We learned that:

- ▶ Good collaboration can achieve a lot.
- ▶ Admission of HDU patients is a complex process involving multiple factors – some beyond the reach of projects of this kind, e.g. staffing levels in different departments.
- ▶ It takes ongoing vigilance to maintain the achieved goals of improving the care of HDU patients in ED.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

Waiting room

- The waiting area is clean, safe, and comfortable.
- Information is provided about triage processes, expected waiting times, and alternate care options.
- Separate waiting areas are available for patients requiring isolation for infection control.
- Other waiting areas may be available for children or for people with behavioural disturbance.

Early initiation of treatment

- First aid and symptom control are provided if needed whilst the patient is waiting for full assessment.

Ongoing monitoring and escalation of deterioration

- The ED team ensures that patients waiting are reassessed regularly by an ED team member to identify any clinical deterioration, to enable a timely and appropriate response.
- The ED team has a mechanism to allow patients, family members or carers to escalate their concerns about deterioration to senior ED or hospital staff, this is made clearly available and accessible, and will be responded to appropriately.

Shared care with ambulance services or other agencies

- When the ED lacks capacity for the ambulance service to safely handover care of their patient, there will be a clear system for identifying clinical responsibility for the patient until such handover can occur.

Intent

Patients who present to the ED are allocated an assessment priority that aligns with the Australasian Triage Scale (ATS). Patients are identified using demographic data, relevant medical notes are obtained or linked to.

Patients required to wait for treatment are informed about anticipated waiting times and regularly observed by the ED team. Any clinical deterioration that occurs whilst waiting is identified and acted upon.

Faster relief for patients with abdominal pain – nurse initiated analgesia

We found that patients presenting with abdominal pain to the Emergency Department had to wait too long for pain relief other than paracetamol, e.g.

Triage Category 4 with abdominal pain. Time to analgesia = **147 minutes**

Triage Category 3 with abdominal pain. Time to analgesia = **100 minutes**

There was also no existing hospital policy for nurses to initiate medication.

Our solution was to develop and implement the Nursing Initiated Analgesia Project. This focussed on collaboration between ED nursing staff and the ED pharmacy to develop ED-specific guidelines on nurse-initiated analgesia. This initiative reduced the time between patients presenting to ED with abdominal pain and receiving pain relief.

What we learned from this process is that abdominal pain presentations are very common in ED and need prompt intervention with effective analgesia.

We also identified some barriers that make it harder for nurses to work effectively. These included having a high triage nurse workload and the importance of the early application of formal pain scores.

Improving the management of patients with transient ischaemic attack in the ED

Our ED had no uniform approach to managing transient ischaemic attack (TIA) patients.

We found that there had been incomplete bedside and imaging investigations in the ED before patients were discharged and there was no guideline-based planning for discharge that included a plan for medication.

We collaborated with both the neurology department and radiology department to develop a TIA pathway that would enhance ED care for TIA patients. We also implemented an ongoing audit of our processes against the pathway.

This new pathway improved the delivery of ED care to TIA patients, and included the following steps:

- ▶ all TIA patients to have OP MRI and echocardiography;
- ▶ all TIA patients to be discharged with a list of medications approved by the neurology department;
- ▶ all TIA patients to be seen by a neurology/stroke team before discharge from the ED.

This improved both patient care and patients' satisfaction with the ED experience.

The process of creating a better plan for TIA patients highlighted the importance of evidence-based care in the ED – i.e. the development of evidence-based guidelines. It also underscored the value of collaborative work between the ED and other specialty departments, and how this collaboration can improve patient care, patient outcomes and a patient's overall hospital experience.

Each patient will have observations of their vital signs recorded whilst in the ED.

- Vital signs are recorded as soon as is practicable at or after triage.
- Vital signs may include but are not limited to the following: pulse, blood pressure, oxygen saturations, respiratory rate, temperature, blood sugar level, level of consciousness (AVPU Scale and Glasgow Coma Scale).
- Ongoing monitoring of relevant vital signs will be conducted according to clinical need.

Intent

The assessment, investigative and diagnostic process is patient-centered, timely, reliable, and of high-quality. A working diagnosis or list of possible diagnoses will be developed and discussed with the patient. Treatment and assessment may occur concurrently. Repeated assessment may be required.

Reducing unnecessary requests for venous blood gas tests in the ED

Our ED had high numbers of requests for venous blood gas (VBG) tests, including unnecessary International Normalised Ratio (INR) requests for young patients who were not taking anticoagulants.

These unnecessary tests were both a risk to patients and an extra burden in terms of resources and costs for the ED.

We did an audit of VBG requests, looking at whether the requests for these tests were clinically indicated, and implemented extra education for nurses to raise awareness of the indications for VBG tests.

We also provided additional education and communication within the ED to promote the need to reduce the number of unnecessary coagulation tests.

These initiatives led to:

- ▶ Increased staff awareness of unnecessary tests in ED.
- ▶ Fewer unnecessary coagulation tests.
- ▶ Increased awareness across the ED team of available guidelines and indications for VBG requests.

The initiatives also increased collaboration between nursing and medical staff as part of improving patient care and led to nurse-initiated projects to raise awareness of these issues among nursing staff.

A focused examination of physical condition or mental state is performed, and repeated when indicated.

- Patients receive a physical and/or mental state examination related to their presentation by an appropriate member of the ED team, which is comprehensive enough to determine underlying conditions or relevant complications.
- The patient's privacy, dignity and safety are maintained throughout the examination.
- Consent for examination is obtained from the patient (or guardian).
- Where possible, patient preference for gender of examiner is taken into consideration.
- Chaperoned examination is available and utilised appropriately.

Intent

The assessment, investigative and diagnostic process is patient-centered, timely, reliable, and of high-quality. A working diagnosis or list of possible diagnoses will be developed and discussed with the patient. Treatment and assessment may occur concurrently. Repeated assessment may be required.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Rational investigation-requesting practices are used in the ED to ensure investigations are relevant to the patient and their presenting problem, and the results are acknowledged, documented, and acted on appropriately.

- The ED team implements an evidence-based, rational investigation requesting protocol.
- Relevant point of care testing is available.
- The results of frequently requested biochemical and haematological tests are available within one hour of blood being taken.
- Results of investigations are clearly communicated to the patient.
- Results of investigations are communicated with the patient's other healthcare providers.
- The results of investigations initiated by the ED team must be reviewed and documented by the ED team when available. The ED team has a system for reviewing and acting on delayed or amended results and communicating important results to the patient.
- The follow-up of outstanding test results is an explicit component of clinical handover, ensuring results are followed up within a clinically suitable timeframe.
- Investigation results that are not immediately necessary for the provision of emergency care should not delay patient movement to another area e.g. admission to the ward, return to a waiting area.

Intent

The assessment, investigative and diagnostic process is patient-centered, timely, reliable, and of high-quality. A working diagnosis or list of possible diagnoses will be developed and discussed with the patient. Treatment and assessment may occur concurrently. Repeated assessment may be required.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Improving the management of patients with transient ischaemic attack in the ED

Our ED had no uniform approach to managing transient ischaemic attack (TIA) patients.

We found that there had been incomplete bedside and imaging investigations in the ED before patients were discharged and there was no guideline-based planning for discharge that included a plan for medication.

We collaborated with both the neurology department and radiology department to develop a TIA pathway that would enhance ED care for TIA patients. We also implemented an ongoing audit of our processes against the pathway.

This new pathway improved the delivery of ED care to TIA patients, and included the following steps:

- ▶ all TIA patients to have OP MRI and echocardiography;
- ▶ all TIA patients to be discharged with a list of medications approved by the neurology department;
- ▶ all TIA patients to be seen by a neurology/stroke team before discharge from the ED.

This improved both patient care and patients' satisfaction with the ED experience.

The process of creating a better plan for TIA patients highlighted the importance of evidence-based care in the ED – i.e. the development of evidence-based guidelines. It also underscored the value of collaborative work between the ED and other specialty departments, and how this collaboration can improve patient care, patient outcomes and a patient's overall hospital experience.

Reducing unnecessary requests for venous blood gas tests in the ED

Our ED had high numbers of requests for venous blood gas (VBG) tests, including unnecessary International Normalised Ratio (INR) requests for young patients who were not taking anticoagulants.

These unnecessary tests were both a risk to patients and an extra burden in terms of resources and costs for the ED.

We did an audit of VBG requests, looking at whether the requests for these tests were clinically indicated, and implemented extra education for nurses to raise awareness of the indications for VBG tests.

We also provided additional education and communication within the ED to promote the need to reduce the number of unnecessary coagulation tests.

These initiatives led to:

- ▶ Increased staff awareness of unnecessary tests in ED.
- ▶ Fewer unnecessary coagulation tests.
- ▶ Increased awareness across the ED team of available guidelines and indications for VBG requests.

The initiatives also increased collaboration between nursing and medical staff as part of improving patient care and led to nurse-initiated projects to raise awareness of these issues among nursing staff.

Development of provisional diagnosis

- The ED team works together to develop a working diagnosis and differential diagnoses, acknowledging that a definitive diagnosis might not be reached during the patient's time in the ED.
- The ED team recognise the effects of cognitive bias, working conditions and other human factors that may compromise clinical decision-making and work to minimise their impact.
- Decision support resources are available.

Communication of provisional diagnosis

- The ED team ensures the patient is informed and involved in the explanation about their condition, provisional and differential diagnoses.
- The uncertainty inherent in diagnostic processes is shared with the patient, including that understanding of the patient's condition, and the condition itself, are likely to change over time.
- The ED team ensures that information is delivered in a way that is appropriate for the patient's cultural, language and educational background.
- The ED team ensures that the patient's concerns regarding their condition are addressed.
- The ED team ensures that the patient's privacy is maintained during discussions regarding their condition.
- A range of fact sheets that are appropriate to the patient's cultural, language and educational background regarding specific diagnoses are available to the patient.

Intent

The assessment, investigative and diagnostic process is patient-centered, timely, reliable, and of high-quality. A working diagnosis or list of possible diagnoses will be developed and discussed with the patient. Treatment and assessment may occur concurrently. Repeated assessment may be required.

The ED team provides care that addresses the specific needs of each patient, their family or carer, and ensures that there is a consistent mechanism for the provision of specialist advice and care.

The ED team is aware that patients may have different needs in addition to their most pressing clinical needs. Culturally and psychologically safe care is provided, taking into account each patient's unique background and circumstances.

- Plans for management are to be made with the patient as co-creator of the plan, taking into account any mismatch of priorities between patient and ED team.
- Patients have access to support staff such as cultural liaison officers and have the opportunity to discuss plans with others (such as family) before making decisions.
- Patients have opportunities to ask questions and seek further opinions.

Intent

The investigative and diagnostic process is patient-centred and produces timely, reliable, and high-quality results. Whilst a definitive diagnosis might not be achieved by the ED team, a comprehensive care plan based on a differential diagnosis list will be developed in consultation with the patient and other team members as required.

Assistance from senior members of staff is available when required.

- Seriously or critically ill patients will have a senior emergency medicine physician involved in the care as early as is practicable.
- Junior doctors will consult with a designated senior doctor in the ED regarding diagnosis, investigation, and care plan of all patients.
- The ED team has a mechanism to access FACEM advice on-site, or remotely within the regional network.
- The ED team has processes to access consultation from senior staff or specialists from other craft groups outside of the ED, including documentation of advice and decisions.

Intent

The investigative and diagnostic process is patient-centred and produces timely, reliable, and high-quality results. Whilst a definitive diagnosis might not be achieved by the ED team, a comprehensive care plan based on a differential diagnosis list will be developed in consultation with the patient and other team members as required.

Reducing lengths of stay for high-dependency patients in the ED

Our high-dependency unit (HDU) patients were experiencing prolonged lengths of stay (LOS) in the ED, ranging from five to 15 hours.

To tackle the problem we developed the ED-HDU Project. This was a collaboration between the ED and ICU, with support from the hospital's Continuous Improvement Department, and aiming to reduce the LOS for these patients to under six hours.

The ED-HDU project involved:

- ▶ Root cause analysis – this included breaking the HDU patient journey into steps with attributable problems.
- ▶ Extensive staff surveys on the issue.
- ▶ Identifying the top three barriers contributing to prolonged LOS. These were: (i) no defined referral or admission criteria (ii) problems with medical rostering/workload and (iii) lack of clarity about what level of management in-patient wards could provide.

This process led to the following corrective measures:

- ▶ Standardising the referral and handover process.
- ▶ Defining the clinical triggers for referral.
- ▶ Defining the involvement of senior medical staff.
- ▶ Defining the escalation process.
- ▶ Implementing and introducing flow charts.
- ▶ Ongoing checking of results.

The project improved collaboration and communication between the ED and ICU, and eventually reduced the LOS of HDU patients (although there was an initial worsening of the LOS at the start of the project when the LOS increased to 8.08 hours). However, we ultimately reduced LOS for these patients by over an hour to 4.85 hours.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

The ED team ensures that patients requiring consultation from another specialist service are referred as soon as is practicable.

- The reason for referral is accurately communicated to other specialties or care providers.
- The ED team advocates those patients requiring consultation from other specialties or care providers receive review or advice no later than one hour from the time of referral.
- When there is a problem regarding consultation or referral this should be escalated to involve the emergency physician or their delegate and consultant on the admitting team.
- Once a referral for admission has been made, systems such as a once only referral for admission policy should be in place to ensure the provision of timely inpatient care is not delayed.
- The ED team has pre-arranged pathways within the hospital or regional network to support consultation with other specialists.
- The responsible ED team member ensures that, where clinically appropriate, consultation with other specialties occurs during the patient's presentation at the ED.

Intent

The investigative and diagnostic process is patient-centred and produces timely, reliable, and high-quality results. Whilst a definitive diagnosis might not be achieved by the ED team, a comprehensive care plan based on a differential diagnosis list will be developed in consultation with the patient and other team members as required.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

The ED has processes to ensure patients with clinical conditions with a high risk of morbidity or mortality are identified and managed.

- The ED team is familiar with hospital policies and procedures relating to high-risk clinical conditions and consult early with appropriate specialists.
- The ED team closely monitors patients with high-risk conditions.
- The ED ensures that frequent presenters with high-risk clinical conditions have appropriate alerts and management plans for timely, effective and safe care.
- The ED team regularly audits the care of a selection of patients with high-risk clinical conditions.

Intent

The investigative and diagnostic process is patient-centred and produces timely, reliable, and high-quality results. Whilst a definitive diagnosis might not be achieved by the ED team, a comprehensive care plan based on a differential diagnosis list will be developed in consultation with the patient and other team members as required.

Reducing lengths of stay for high-dependency patients in the ED

Our high-dependency unit (HDU) patients were experiencing prolonged lengths of stay (LOS) in the ED, ranging from five to 15 hours.

To tackle the problem we developed the ED-HDU Project. This was a collaboration between the ED and ICU, with support from the hospital's Continuous Improvement Department, and aiming to reduce the LOS for these patients to under six hours.

The ED-HDU project involved:

- ▶ Root cause analysis – this included breaking the HDU patient journey into steps with attributable problems.
- ▶ Extensive staff surveys on the issue.
- ▶ Identifying the top three barriers contributing to prolonged LOS. These were: (i) no defined referral or admission criteria (ii) problems with medical rostering/workload and (iii) lack of clarity about what level of management in-patient wards could provide.

This process led to the following corrective measures:

- ▶ Standardising the referral and handover process.
- ▶ Defining the clinical triggers for referral.
- ▶ Defining the involvement of senior medical staff.
- ▶ Defining the escalation process.
- ▶ Implementing and introducing flow charts.
- ▶ Ongoing checking of results.

The project improved collaboration and communication between the ED and ICU, and eventually reduced the LOS of HDU patients (although there was an initial worsening of the LOS at the start of the project when the LOS increased to 8.08 hours). However, we ultimately reduced LOS for these patients by over an hour to 4.85 hours.

We learned that:

- ▶ Good collaboration can achieve a lot.
- ▶ Admission of HDU patients is a complex process involving multiple factors – some beyond the reach of projects of this kind, e.g. staffing levels in different departments.
- ▶ It takes ongoing vigilance to maintain the achieved goals of improving the care of HDU patients in ED.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

The ED team minimise the risk of hospital acquired infections.

- Hand hygiene is taught, utilised, and monitored.
- Aseptic and sterile techniques are used.
- Judicious use, safe insertion, and timely removal of invasive devices.

Intent
 Each stage of implementation of the comprehensive care plan is coordinated in a manner that promotes a multidisciplinary team approach as well as patient-centered care.
 All attempts to prevent unnecessary harm are made.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Legislation / regulation

The ED has processes in place to ensure that the storing, prescribing, and administering of medications is managed to minimise errors and facilitate patient care and safety.

- The ED team has processes to ensure medication reconciliation takes place.
- The ED team ensures medications are stored safely and securely and in accordance with manufacturer and Legislation / regulation.
- The ED team ensures the safe prescribing and administration of medications is facilitated within the ED environment.
- The ED team advocates for the involvement of pharmacists in the ED to minimise risks associated with prescription and administration of medication.
- The ED team ensures the patient is identified correctly before medication administration.
- The ED team has processes to ensure prescribing information is correct and regularly updated.
- The ED team has processes to ensure the correct prescribing, administration, and recording of medication occurs.
- The ED team ensures patients are monitored following the administration of medications.

Intent

Each stage of implementation of the comprehensive care plan is coordinated in a manner that promotes a multidisciplinary team approach as well as patient-centered care.

All attempts to prevent unnecessary harm are made.

Faster relief for patients with abdominal pain – nurse initiated analgesia

We found that patients presenting with abdominal pain to the Emergency Department had to wait too long for pain relief other than paracetamol, e.g.

- Triage Category 4 with abdominal pain. Time to analgesia = **147 minutes**
- Triage Category 3 with abdominal pain. Time to analgesia = **100 minutes**

There was also no existing hospital policy for nurses to initiate medication.

Our solution was to develop and implement the Nursing Initiated Analgesia Project. This focussed on collaboration between ED nursing staff and the ED pharmacy to develop ED-specific guidelines on nurse-initiated analgesia. This initiative reduced the time between patients presenting to ED with abdominal pain and receiving pain relief.

What we learned from this process is that abdominal pain presentations are very common in ED and need prompt intervention with effective analgesia.

We also identified some barriers that make it harder for nurses to work effectively. These included having a high triage nurse workload and the importance of the early application of formal pain scores.

Expediting safe and prompt transfer for patients from the ED to an inpatient unit

There had been long waits for inpatient teams to attend the ED to admit patients needing inpatient care. This caused delays in transferring patients to available ward beds.

We reduced these delays by identifying cohorts of patients who were suitable for direct transfer from the ED to a ward bed without being seen in the ED by the accepting inpatient team and by developing a four hour Interim Management Plan (IMP).

This plan documents the key treatments needed for these patients during the four hours after leaving the ED. It includes medication, fluids, observation types and frequency, diet status, provisional diagnosis, the name of the accepting unit, and notifying the inpatient clinician of the IMP admission.

Introduction of 'one way' referral to inpatient teams for these patients – leads to "notification of admission" of patients rather than a "referral".

These IMP admissions had to be approved by a senior ED medical officer.

These changes resulted in:

- ▶ Around 60-70% of ED patients assessed as suitable for IMP admission.
- ▶ Reduced delays in inpatient admission for IMP patients because a review of the patient by the inpatient team in ED was no longer a required 'gateway' to a ward.
- ▶ An improvement in the capacity and flow for new patients arriving in ED.
- ▶ Reduction in ED LOS for selected cohorts of patients.

This experience taught us that many patients can proceed safely to an inpatient ward, providing they have been reviewed by a senior ED medical officer first. However, prescription of medications and fluids etc. for the next four hours is a key part of the IMP process – without this, patients may miss important medications or have to wait too long for analgesia.

This system requires careful selection of patients. Some patients will benefit from a longer period in ED and from a review by an inpatient team in ED to guide the most appropriate ward and treatment.

Case studies

Legislation / regulation

- The ED team has processes in place to ensure patients are assessed for risk of falls.
- The ED team ensures the ED environment does not contribute to the risk of falls.
- The ED team ensures there is regular monitoring of patients at risk of falls and preventative measures in place.
- The ED team ensures early review of any patient who may have fallen in the ED.

Intent

Each stage of implementation of the comprehensive care plan is coordinated in a manner that promotes a multidisciplinary team approach as well as patient-centered care.

All attempts to prevent unnecessary harm are made.

Legislation / regulation

- Risks are minimised by undertaking strategies to recognise, prevent, treat, and manage cognitive impairment, including endeavouring to allow restorative rest and sleep for patients.
- Clinicians, patients, carers, and families work together to minimise anxiety or distress experienced by any person with cognitive impairment.
- The use of antipsychotics and other psychoactive medicines is in line with best practice and relevant legislation.

Intent

Each stage of implementation of the comprehensive care plan is coordinated in a manner that promotes a multidisciplinary team approach as well as patient-centered care.

All attempts to prevent unnecessary harm are made.

- The ED team has a protocol to identify and manage behaviourally disturbed patients.
- The ED team receives training and support in best practice de-escalation techniques.
- The ED team receives training on and promotes trauma-informed care to achieve best outcomes for all patients.

Intent

Each stage of implementation of the comprehensive care plan is coordinated in a manner that promotes a multidisciplinary team approach as well as patient-centered care.

All attempts to prevent unnecessary harm are made.

Legislation / regulation

- Physical or chemical restraint are minimised or avoided if possible.
- Where restraint is clinically necessary to prevent harm, the ED team has systems to provide restraint safely and for the shortest possible time.
- Careful monitoring of the restrained patient is provided at all times.
- Restraint is documented and notified as required.

Intent

Each stage of implementation of the comprehensive care plan is coordinated in a manner that promotes a multidisciplinary team approach as well as patient-centered care.

All attempts to prevent unnecessary harm are made.

- The ED team has processes in place to identify the monitoring requirements for each patient.
- The ED team ensures any required monitoring is carried out.
- The ED team ensures that any deterioration noted is acted upon.
- The ED team maintains processes by which any concerns raised by patient, family or carer about deterioration will be heard and acted upon, including clear paths for escalation of concerns.

Intent

Each stage of implementation of the comprehensive care plan is coordinated in a manner that promotes a multidisciplinary team approach as well as patient-centered care.

All attempts to prevent unnecessary harm are made.

Reducing lengths of stay for high-dependency patients in the ED

Our high-dependency unit (HDU) patients were experiencing prolonged lengths of stay (LOS) in the ED, ranging from five to 15 hours.

To tackle the problem we developed the ED-HDU Project. This was a collaboration between the ED and ICU, with support from the hospital's Continuous Improvement Department, and aiming to reduce the LOS for these patients to under six hours.

The ED-HDU project involved:

- ▶ Root cause analysis – this included breaking the HDU patient journey into steps with attributable problems.
- ▶ Extensive staff surveys on the issue.
- ▶ Identifying the top three barriers contributing to prolonged LOS. These were: (i) no defined referral or admission criteria (ii) problems with medical rostering/workload and (iii) lack of clarity about what level of management in-patient wards could provide.

This process led to the following corrective measures:

- ▶ Standardising the referral and handover process.
- ▶ Defining the clinical triggers for referral.
- ▶ Defining the involvement of senior medical staff.
- ▶ Defining the escalation process.
- ▶ Implementing and introducing flow charts.
- ▶ Ongoing checking of results.

The project improved collaboration and communication between the ED and ICU, and eventually reduced the LOS of HDU patients (although there was an initial worsening of the LOS at the start of the project when the LOS increased to 8.08 hours). However, we ultimately reduced LOS for these patients by over an hour to 4.85 hours.

We learned that:

- ▶ Good collaboration can achieve a lot.
- ▶ Admission of HDU patients is a complex process involving multiple factors – some beyond the reach of projects of this kind, e.g. staffing levels in different departments.
- ▶ It takes ongoing vigilance to maintain the achieved goals of improving the care of HDU patients in ED.

- The ED team ensures ED-performed interventional procedures are performed in a timely manner.
- The ED team ensures consent procedures comply with relevant jurisdictional legislation and quality standards.
- The ED team implements processes to ensure correct patient, and both side and site where not self-evident, are identified prior to performing interventional procedures.
- The ED team ensures that relevant infection control standards are maintained when performing interventional procedures.
- The ED team ensures adherence to best practices in emergency procedures.
- The presence of high-risk departmental or patient factors are contraindications to the safe administration of procedural sedation in the ED.

Intent

Each stage of implementation of the comprehensive care plan is coordinated in a manner that promotes a multidisciplinary team approach as well as patient-centered care.

All attempts to prevent unnecessary harm are made.

Legislation / regulation

- The ED team ensures that the decision to admit a patient to hospital from the ED is made by an emergency physician or their delegate, in consultation with other specialist healthcare providers where required.
- The hospital and ED team ensure patient admission is decided on clinical criteria, not on bed availability.
- The ED team ensures that the decision to admit is made with the patient.
- The patient is informed about admission processes by the ED team.
- The ED team has a process for instances when a patient declines hospital admission.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Prior to leaving the ED, patients are screened by the relevant ED team member or delegate to ensure the destination and manner of transfer are suitable and safe.

Reducing lengths of stay for high-dependency patients in the ED

Our high-dependency unit (HDU) patients were experiencing prolonged lengths of stay (LOS) in the ED, ranging from five to 15 hours.

To tackle the problem we developed the ED-HDU Project. This was a collaboration between the ED and ICU, with support from the hospital's Continuous Improvement Department, and aiming to reduce the LOS for these patients to under six hours.

The ED-HDU project involved:

- ▶ Root cause analysis – this included breaking the HDU patient journey into steps with attributable problems.
- ▶ Extensive staff surveys on the issue.
- ▶ Identifying the top three barriers contributing to prolonged LOS. These were: (i) no defined referral or admission criteria (ii) problems with medical rostering/workload and (iii) lack of clarity about what level of management in-patient wards could provide.

This process led to the following corrective measures:

- ▶ Standardising the referral and handover process.
- ▶ Defining the clinical triggers for referral.
- ▶ Defining the involvement of senior medical staff.
- ▶ Defining the escalation process.
- ▶ Implementing and introducing flow charts.
- ▶ Ongoing checking of results.

The project improved collaboration and communication between the ED and ICU, and eventually reduced the LOS of HDU patients (although there was an initial worsening of the LOS at the start of the project when the LOS increased to 8.08 hours). However, we ultimately reduced LOS for these patients by over an hour to 4.85 hours.

We learned that:

- ▶ Good collaboration can achieve a lot.
- ▶ Admission of HDU patients is a complex process involving multiple factors – some beyond the reach of projects of this kind, e.g. staffing levels in different departments.
- ▶ It takes ongoing vigilance to maintain the achieved goals of improving the care of HDU patients in ED.

The importance of patient advocacy for Māori patients

A 54-year-old Māori man presented with haemoptysis and fever via a community provider. He lived in temporary housing out of the area and was hearing impaired. After a previous visit to the hospital with similar problems, he had missed a follow up phone call because he was unable to hear his phone and had no phone credit to return the call.

He had difficulty swallowing, hadn't eaten for five days and, on assessment in the ED, was unable to swallow without coughing. We expedited his outpatient CT thorax scan which revealed a large oesophageal mass that had eroded the trachea, creating a fistula. He was admitted under the surgical service and began treatment in hospital.

Our local Māori Health Team was involved in transport and follow up and, after discussion with the admitting doctor, the surgical team admitted the patient even though he resided outside the area.

It was heartening to see that patient advocacy worked for this patient. He was able to have a diagnosis and treatment, along with holistic support from the Māori Health Team.

There are many reasons why a patient might not return for follow up checks or treatment, and this example highlights the need for individualised and flexible approaches to patient care.

Following the ED team decision to admit a patient, referral to the inpatient unit occurs in a timely manner ensuring adequate communication between the ED and the relevant inpatient unit.

- The ED team ensures that referrals for admission are made as soon as is practicable.
- The ED team advocates that any patient referred for review or admission is reviewed within one hour from time of referral.
- The reason for referral is accurately communicated to other specialties or care providers. Standardised handover tools such as ISBAR or iSoBAR are available.
- The ED team has effective and efficient processes for escalating and managing problems relating to referrals or consultation, including any need for further referral or consultation.
- The ED team ensures that the admitting specialist team is informed of every admission including those occurring after hours.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

Legislation / regulation

All patients are eligible for access to hospital inpatient units, and admission should occur in a timely manner.

- The ED team works with the hospital to ensure that admission processes occur in a safe, appropriate, and timely manner.
- The ED team will advocate for direct to ward admissions wherever clinically indicated.
- The ED team will advocate that the patient will leave the ED within one hour of the decision to admit unless this will compromise the care of the patient.
- The ED team will ensure the patient leaves the ED with all relevant patient history and treatment records, urgent investigation results obtained, and interim treatment orders written for up to six hours, ideally by the admitting team.
- The admitting unit is responsible for the timely development and documentation of the treatment plan and associated medication orders beyond this six hour time period.
- The ED team ensures that patients referred for direct admission are safe for transfer to the inpatient unit to await further assessment and treatment by the inpatient team.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Prior to leaving the ED, patients are screened by the relevant ED team member or delegate to ensure the destination and manner of transfer are suitable and safe.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

The importance of patient advocacy for Māori patients

A 54-year-old Māori man presented with haemoptysis and fever via a community provider. He lived in temporary housing out of the area and was hearing impaired. After a previous visit to the hospital with similar problems, he had missed a follow up phone call because he was unable to hear his phone and had no phone credit to return the call.

He had difficulty swallowing, hadn't eaten for five days and, on assessment in the ED, was unable to swallow without coughing. We expedited his outpatient CT thorax scan which revealed a large oesophageal mass that had eroded the trachea, creating a fistula. He was admitted under the surgical service and began treatment in hospital.

Our local Māori Health Team was involved in transport and follow up and, after discussion with the admitting doctor, the surgical team admitted the patient even though he resided outside the area.

It was heartening to see that patient advocacy worked for this patient. He was able to have a diagnosis and treatment, along with holistic support from the Māori Health Team.

There are many reasons why a patient might not return for follow up checks or treatment, and this example highlights the need for individualised and flexible approaches to patient care.

Expediting safe and prompt transfer for patients from the ED to an inpatient unit

There had been long waits for inpatient teams to attend the ED to admit patients needing inpatient care. This caused delays in transferring patients to available ward beds.

We reduced these delays by identifying cohorts of patients who were suitable for direct transfer from the ED to a ward bed without being seen in the ED by the accepting inpatient team and by developing a four hour Interim Management Plan (IMP).

This plan documents the key treatments needed for these patients during the four hours after leaving the ED. It includes medication, fluids, observation types and frequency, diet status, provisional diagnosis, the name of the accepting unit, and notifying the inpatient clinician of the IMP admission.

Introduction of 'one way' referral to inpatient teams for these patients – leads to "notification of admission" of patients rather than a "referral".

These IMP admissions had to be approved by a senior ED medical officer.

These changes resulted in:

- ▶ Around 60-70% of ED patients assessed as suitable for IMP admission.
- ▶ Reduced delays in inpatient admission for IMP patients because a review of the patient by the inpatient team in ED was no longer a required 'gateway' to a ward.
- ▶ An improvement in the capacity and flow for new patients arriving in ED.
- ▶ Reduction in ED LOS for selected cohorts of patients.

This experience taught us that many patients can proceed safely to an inpatient ward, providing they have been reviewed by a senior ED medical officer first. However, prescription of medications and fluids etc. for the next four hours is a key part of the IMP process – without this, patients may miss important medications or have to wait too long for analgesia.

This system requires careful selection of patients. Some patients will benefit from a longer period in ED and from a review by an inpatient team in ED to guide the most appropriate ward and treatment.

Reducing lengths of stay for high-dependency patients in the ED

Our high-dependency unit (HDU) patients were experiencing prolonged lengths of stay (LOS) in the ED, ranging from five to 15 hours.

To tackle the problem we developed the ED-HDU Project. This was a collaboration between the ED and ICU, with support from the hospital's Continuous Improvement Department, and aiming to reduce the LOS for these patients to under six hours.

The ED-HDU project involved:

- ▶ Root cause analysis – this included breaking the HDU patient journey into steps with attributable problems.
- ▶ Extensive staff surveys on the issue.
- ▶ Identifying the top three barriers contributing to prolonged LOS. These were: (i) no defined referral or admission criteria (ii) problems with medical rostering/workload and (iii) lack of clarity about what level of management in-patient wards could provide.

This process led to the following corrective measures:

- ▶ Standardising the referral and handover process.
- ▶ Defining the clinical triggers for referral.
- ▶ Defining the involvement of senior medical staff.
- ▶ Defining the escalation process.
- ▶ Implementing and introducing flow charts.
- ▶ Ongoing checking of results.

The project improved collaboration and communication between the ED and ICU, and eventually reduced the LOS of HDU patients (although there was an initial worsening of the LOS at the start of the project when the LOS increased to 8.08 hours). However, we ultimately reduced LOS for these patients by over an hour to 4.85 hours.

We learned that:

- ▶ Good collaboration can achieve a lot.
- ▶ Admission of HDU patients is a complex process involving multiple factors – some beyond the reach of projects of this kind, e.g. staffing levels in different departments.
- ▶ It takes ongoing vigilance to maintain the achieved goals of improving the care of HDU patients in ED.

- The ED team and hospital have clear agreements as to the responsibility for referral for transfer to another hospital or healthcare facility when appropriate care cannot be provided locally.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Prior to leaving the ED, patients are screened by the relevant ED team member or delegate to ensure the destination and manner of transfer are suitable and safe.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

The ED team utilises a referral and transfer protocol that ensures safety and continuity of care for patients being transferred to another hospital, healthcare, or residential care facility.

- The ED team ensures the patient is informed about reasons, risks, and benefits of transfer to another hospital or healthcare facility.
- The ED team has protocols in place with pre-hospital and retrieval services to ensure suitable transport options are available.
- The ED team is trained in preparing patients for transport.
- The ED team ensures that referral documentation contains sufficient information to facilitate ongoing care and that the patient is accompanied by all relevant patient history and treatment records.
- The ED team has access, when needed, to qualified, equipped, and regulated medical transport teams for the transport of critically ill or injured patients, neonates, and other patients requiring specialised care.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Legislation / regulation

The decision to discharge a patient from the ED is made with the patient and they are informed about discharge processes.

- The ED team ensures that the decision to discharge a patient is communicated to the patient.
- The ED team ensures that there is a documented discharge plan for every occasion of service, developed in consultation with the patient, recorded in the patient file and shared with the patient. This is transmitted directly to the patient's nominated primary care provider, unless instructed otherwise by the patient.
- The ED team ensures that the discharge plan is appropriate to the patient's cultural, socio-economic, language and educational background.
- The ED team ensures that the patient is informed about community options and when to seek further assistance following discharge.
- The discharge processes described above are the responsibility of the relevant inpatient teams in those instances where "admitted patients" have remained within the ED as a result of access block.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Prior to leaving the ED, patients are screened by the relevant ED team member or delegate to ensure the destination and manner of transfer are suitable and safe.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Improving the management of patients with transient ischaemic attack in the ED

Our ED had no uniform approach to managing transient ischaemic attack (TIA) patients.

We found that there had been incomplete bedside and imaging investigations in the ED before patients were discharged and there was no guideline-based planning for discharge that included a plan for medication.

We collaborated with both the neurology department and radiology department to develop a TIA pathway that would enhance ED care for TIA patients. We also implemented an ongoing audit of our processes against the pathway.

This new pathway improved the delivery of ED care to TIA patients, and included the following steps:

- ▶ all TIA patients to have OP MRI and echocardiography;
- ▶ all TIA patients to be discharged with a list of medications approved by the neurology department;
- ▶ all TIA patients to be seen by a neurology/stroke team before discharge from the ED.

This improved both patient care and patients' satisfaction with the ED experience.

The process of creating a better plan for TIA patients highlighted the importance of evidence-based care in the ED – i.e. the development of evidence-based guidelines. It also underscored the value of collaborative work between the ED and other specialty departments, and how this collaboration can improve patient care, patient outcomes and a patient's overall hospital experience.

Ensuring good communication with GPs and other health professionals

Discharge letters are important for continuity of care and following up test results. But many GPs had complained that discharge letters from the ED were not sent directly to them. Other feedback suggested these letters were often of poor quality and did not clearly explain what the ED was asking the GP to review or follow up.

The ED's management of discharge letters for GPs was also inconsistent, with some doctors giving letters to patients, while others faxed or posted them to GPs. There was also no way of checking how or when a discharge letter may have been sent to a GP.

Our approach was to develop a standardised discharge letter template using SBAR (situation, background, assessment and recommendation). The template was made available across EMR for use. We also introduced the use of a secure web transfer portal that enabled ED staff to send emails directly to GPs and check that a discharge letter had been sent.

This improved the quality of discharge letters, and resulted in more of these letters reaching GPs. It was also easier to confirm that a discharge letter had been sent.

However, there are still ongoing challenges including compliance with the use of the recommended SBAR format and the fact that patients often change GPs and this is not always updated in EMR.

Having a consistent electronic process improves compliance and auditing – although it also requires giving instructions to large numbers of rotating junior medical officers which is time consuming.

GPs themselves are also important stakeholders in developing this process, both in relation to the quality and key elements of a discharge letter and to how it is transmitted.

Legislation / regulation

The ED team ensures that on discharge, referrals and discharge letters have been communicated to the patient, and the relevant provider to ensure that the patient is supported through the next phase of care.

- The ED team ensures, in conjunction with the patient's primary healthcare provider, that patients requiring consultation from another healthcare service as an outpatient will be referred as soon as possible.
- The ED team ensures that the reason for referral is accurately documented in the referral from ED and recorded in the patient file.
- The ED team considers the most appropriate referral with respect to patient's home location and ability to access care.
- The ED team ensures the patient is involved in discussion about treatment and provider options for referral.
- The ED team ensures information is provided to ensure the patient is supported in arranging follow up care with the provider to whom they are referred.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Prior to leaving the ED, patients are screened by the relevant ED team member or delegate to ensure the destination and manner of transfer are suitable and safe.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

The ED Team ensures instructions have been provided to the patient regarding requirements to assist in the patient's treatment, including the timing and other services that may be involved to monitor or review their condition.

- The ED team ensures patients are provided with information regarding re-presentation to the ED or primary care physician, including symptoms and signs of clinical deterioration (safety-netting), and discussion of the potential for evolution of the patient's condition and possible change in working diagnosis.
- Written information and discharge instructions are provided in a language that is clear to the patient.
- Documentation in the patient file reflects the content and provision of discharge instructions.
- A summary of the ED visit is given to the patient.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Prior to leaving the ED, patients are screened by the relevant ED team member or delegate to ensure the destination and manner of transfer are suitable and safe.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Case study 2

Improving the management of patients with transient ischaemic attack in the ED

Our ED had no uniform approach to managing transient ischaemic attack (TIA) patients.

We found that there had been incomplete bedside and imaging investigations in the ED before patients were discharged and there was no guideline-based planning for discharge that included a plan for medication.

We collaborated with both the neurology department and radiology department to develop a TIA pathway that would enhance ED care for TIA patients. We also implemented an ongoing audit of our processes against the pathway.

This new pathway improved the delivery of ED care to TIA patients, and included the following steps:

- ▶ all TIA patients to have OP MRI and echocardiography;
- ▶ all TIA patients to be discharged with a list of medications approved by the neurology department;
- ▶ all TIA patients to be seen by a neurology/stroke team before discharge from the ED.

This improved both patient care and patients' satisfaction with the ED experience.

The process of creating a better plan for TIA patients highlighted the importance of evidence-based care in the ED – i.e. the development of evidence-based guidelines. It also underscored the value of collaborative work between the ED and other specialty departments, and how this collaboration can improve patient care, patient outcomes and a patient's overall hospital experience.

The ED team ensures patients receive adequate instruction regarding medication prescription and administration.

- The ED team has clear systems for providing patients with instruction regarding prescription and administration of medication post discharge.
- These instructions may be shared with relevant caregivers e.g. at home, residential aged care facility, prison etc.
- The ED team has a process for after-hours dispensing of medication that includes recording the dispense in the notes.
- The ED team ensures that the patient is informed about what to do in the event of an adverse reaction to medication.
- The ED team ensures that medication information is provided with consideration for cultural, language, educational and health literacy factors.
- The patient is involved in the development of a medication management plan.

Intent

There is a structured clinical handover at all points of transition of care, including when a patient leaves or returns to the ED, and whenever staff changeovers occur.

Relevant, accurate and current information about a patient's care is transferred to the right person or people and continuity of patient care is maintained.

Prior to leaving the ED, patients are screened by the relevant ED team member or delegate to ensure the destination and manner of transfer are suitable and safe.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Case study 2

Improving the management of patients with transient ischaemic attack in the ED

Our ED had no uniform approach to managing transient ischaemic attack (TIA) patients.

We found that there had been incomplete bedside and imaging investigations in the ED before patients were discharged and there was no guideline-based planning for discharge that included a plan for medication.

We collaborated with both the neurology department and radiology department to develop a TIA pathway that would enhance ED care for TIA patients. We also implemented an ongoing audit of our processes against the pathway.

This new pathway improved the delivery of ED care to TIA patients, and included the following steps:

- ▶ all TIA patients to have OP MRI and echocardiography;
- ▶ all TIA patients to be discharged with a list of medications approved by the neurology department;
- ▶ all TIA patients to be seen by a neurology/stroke team before discharge from the ED.

This improved both patient care and patients' satisfaction with the ED experience.

The process of creating a better plan for TIA patients highlighted the importance of evidence-based care in the ED – i.e. the development of evidence-based guidelines. It also underscored the value of collaborative work between the ED and other specialty departments, and how this collaboration can improve patient care, patient outcomes and a patient's overall hospital experience.

Criteria

- The ED team provides care that is respectful of patients' diverse backgrounds and needs.
- The ED team ensures that patients, regardless of age or ability, have their dignity respected and preserved by systems designed to minimise any functional decline in their abilities during their ED stay.
- The ED team ensures that a suitably skilled workforce is accessible for all groups of patients, either in person or via telemedicine.
- The ED team ensures that emergency care is responsive and sensitive to the specific needs of marginalised patient groups.
- The ED team collaborates with marginalised patient groups or their advocates in the planning and provision of services.
- The ED team is trained in the delivery of culturally safe care.
- The ED team is trained in the delivery of trauma informed care.
- The ED environment is designed to allow the provision of culturally sensitive and safe care.

This group may include but is not limited to

Children, adolescents

Pregnant and post-partum people

Elderly or physically frail people

Intent

Marginalised, vulnerable, and high-risk patients who present to the ED receive care that is focused on ensuring suitable communication and engagement between the patient and caregiver, endeavouring to meet the identified needs of the patient. Care should consider the requirements of such patients with respect to environment, equipment, and ED team skills.

This group may include but is not limited to

People with disabilities and impairments

First Nations people – Aboriginal and Torres Strait Islander, Māori, Pacific peoples

Gender diverse people, including those transitioning, LGBTQI people

People of CALD background including migrants, asylum seekers, refugees

People with mental health conditions

People with alcohol or drug use disorders

People exposed to trauma – current or past, physical/sexual/psychological

People subject to family and domestic violence and abuse

People in custody or care who may have reduced agency in accessing healthcare

People experiencing housing instability and/or poverty

Intent

Marginalised, vulnerable, and high-risk patients who present to the ED receive care that is focused on ensuring suitable communication and engagement between the patient and caregiver, endeavouring to meet the identified needs of the patient. Care should consider the requirements of such patients with respect to environment, equipment, and ED team skills.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

Case study 2

The importance of patient advocacy for Māori patients

A 54-year-old Māori man presented with haemoptysis and fever via a community provider. He lived in temporary housing out of the area and was hearing impaired. After a previous visit to the hospital with similar problems, he had missed a follow up phone call because he was unable to hear his phone and had no phone credit to return the call.

He had difficulty swallowing, hadn't eaten for five days and, on assessment in the ED, was unable to swallow without coughing. We expedited his outpatient CT thorax scan which revealed a large oesophageal mass that had eroded the trachea, creating a fistula. He was admitted under the surgical service and began treatment in hospital.

Our local Māori Health Team was involved in transport and follow up and, after discussion with the admitting doctor, the surgical team admitted the patient even though he resided outside the area.

It was heartening to see that patient advocacy worked for this patient. He was able to have a diagnosis and treatment, along with holistic support from the Māori Health Team.

There are many reasons why a patient might not return for follow up checks or treatment, and this example highlights the need for individualised and flexible approaches to patient care.

- The ED team has a protocol for screening patients approaching the end of life who may benefit from advance care plans and advocate for their completion.
- Patients and their families or carer are involved and supported in making decisions about care for a person who is dying.
- The ED team has a process to identify and involve a nominated decision maker for situations in which the patient's decision-making capacity is impaired.
- The ED team is trained to promote goals of care and avoid futile treatments when providing care for the dying person and has processes for documenting clear goals of care made in collaboration with the patient and their family.
- The ED team is equipped to provide palliative care to patients within the ED.
- The ED team has a process by which humane care is provided to patients presenting with imminent death.
- The ED team has a process to allow a patient's family members or carer into the resuscitation room.
- The ED team has processes in place to preserve a patient's choices, dignity, and control.
- The ED team receive training to support them in providing care to patients who are dying.
- End of life care pathways are utilised where available.
- The ED team considers the emotional, cultural, and spiritual needs of a patient, their family or carer at the end of life, and have a process to offer contact with a preferred spiritual representative, social worker and/or mental health professional.
- The ED team ensures the patient, their family or carer have access to resources for the care of a dying patient if discharge home is considered.

Intent

Processes and systems are in place to ensure the provision of end-of-life care according to patients' wishes.

The ED team provide care that includes clinical expertise in recognising and managing end-of-life scenarios, facilitation of end-of-life discussions, management of multidisciplinary input, and also supporting the needs of family and/or carers.

Patients, their family, or carer receive respectful and dignified care in the event of expected or unexpected death in the ED. Support is also available for ED team members.

- The ED team has adequate facilities to support bereaved families or carers.
- The ED team has adequate services and mechanisms to ensure patients, their family or carer are supported for expected or unexpected deaths in the ED.
- The ED team is trained to consider cultural differences following death in the ED.
- The hospital has facilities to allow relatives to stay or keep vigil with deceased patients in accordance with their belief and customs. This may be within the ED, the chapel, or the morgue but the relatives must be able to call on hospital staff if necessary.
- The ED team is trained to have knowledge of certification and notification requirements following the death of a patient.
- Support is available for ED team members following the death of a patient.

Intent

Processes and systems are in place to ensure the provision of end-of-life care according to patients' wishes.

The ED team provide care that includes clinical expertise in recognising and managing end-of-life scenarios, facilitation of end-of-life discussions, management of multidisciplinary input, and also supporting the needs of family and/or carers.

The ED team is trained to ensure the wishes of the patient in relation to organ and tissue donation are respected and upheld where possible.

- The ED team has a system to facilitate organ and tissue donation opportunities.
- The ED team has access to jurisdictional advice to enable a patient's intentions regarding organ donation to be known, documented and accessible.
- The ED team ensures accurate information about organ donation is provided to patients, their family or carer.

Intent

Processes and systems are in place to ensure the provision of end-of-life care according to patients' wishes.

The ED team provide care that includes clinical expertise in recognising and managing end-of-life scenarios, facilitation of end-of-life discussions, management of multidisciplinary input, and also supporting the needs of family and/or carers.

- The ED team participates in a collaborative hospital network which supports the secure use of telemedicine and provides the specialist expertise required.
- Where telemedicine is used, the ED team is adequately resourced and has access to functional equipment and is trained and supported in its use.
- The ED team establishes and maintains relationships with specialists who may provide suitable expertise via telemedicine consultation.
- Virtual care is provided in alignment with relevant regulations, legislation, and guidelines.

Intent

The ED team can access and use secure telemedicine or messaging services when needed to enhance the quality of care provided to patients.

Domain 2 / Administration

Intent ▶ This domain describes the overall management of an ED, within the whole of hospital context and as the interface between acute care and the community. It details how EDs deliver patient-centered care by ensuring that physical environment, facilities and resources are fit for purpose, the workforce is suitably trained and supported, and the culture and organisation of the hospital, network, and departmental administration is aligned with this aim.

Standard 2.1 Built environment

Objective A	ED design	>
Objective B	ED layout	>
Objective C	ED capacity	>
Objective D	ED accessibility	>
Objective E	Infection control	>
Objective F	Staff facilities	>
Objective G	Facilities for patients and visitors	>

Standard 2.2 Equipment, medication, disposables

Objective A	Functional equipment	>
Objective B	Maintenance and replacement of equipment	>
Objective C	Appropriate PPE	>
Objective D	Medication supply	>
Objective E	Disposables storage and supply	>

Standard 2.3 IT resources

Objective A	Management of patient information	>
Objective B	Management of data integrity	>
Objective C	Systems to facilitate monitoring data	>
Objective D	Maintenance of IT services	>
Objective E	Access to information and data in the ED	>

Standard 2.4 Workforce management

Objective A	ED team numbers and skill-mix	>
Objective B	Recruitment	>
Objective C	Feedback and performance appraisal	>
Objective D	Monitoring of turnover	>

The ED design reflects considerations including ergonomics, safety and security, amenity, accessibility, image, and consumer expectations whilst allowing for optimal care to be delivered.

- The ED is designed to promote a positive environment for the ED team and patients, families, or carer, embracing cultural values of the local communities including First Nations people.
- The ED team is equipped to be responsive to the needs of marginalised or vulnerable patients and is able to provide early access to areas suitable for these needs.
- The ED team ensures that marginalised or vulnerable patients are not separated from carers.
- The ED team provides an environment which is designed for privacy and quietness to reduce anxiety, noise, confusion, and risk of falling.
- The ED has a mechanism for safe placement of noisy, distracting, or aggressive patients separate from other patients.
- The ED utilises good work design, where hazards and risks are removed or minimised and the wellbeing of workers is prioritised. Optimally, risks to workforce health and wellbeing are “designed out” of the work where possible.

Intent

The ED provides a safe environment that will cater to the needs of different patient groups and to the needs of the ED team members.

The ED layout allows for a safe and effective environment for patients and the ED team.

- The ED complies with relevant guidelines for ED design.
- The ED layout is designed with consideration for the models of care to be implemented by the ED team.
- The layout of the ED allows easy access to equipment and resources by the ED team.
- The ED is designed to ensure both patients and ED team members are safe and secure within the ED.
- The ED is designed to provide privacy and confidentiality for patients.

Intent

The ED provides a safe environment that will cater to the needs of different patient groups and to the needs of the ED team members.

-----------------	------------	------------------------	--------------	--------------------------

The ED is fit for purpose, able to provide optimal safe and comfortable spaces for the patients presenting.
The ED has sufficient and appropriately equipped bays and rooms for all models of care provided.

- The ED has an adequate number of appropriately equipped resuscitation, general and special purpose bays, and decontamination facilities, proportionate to the department's workload and case-mix.
- A short stay unit or acute assessment unit is accessible where possible.
- These are efficiently utilised to optimise resuscitation capacity at all times.
- Appropriate overflow space is available so that patients are not placed in inappropriate spaces such as corridors and hallways.

Intent
 The ED provides a safe environment that will cater to the needs of different patient groups and to the needs of the ED team members.

- The ED can be clearly identified and easily accessed by anyone.
- The ED is located in a part of the hospital easily accessible from the outside, by pedestrians or vehicles.
- Access to the ED complies with relevant building guidelines and accessibility legislation.
- The ED is accessible by people using mobility aids.
- The ED is clearly signposted to enable quick and simple wayfinding.

Intent
 The ED provides a safe environment that will cater to the needs of different patient groups and to the needs of the ED team members.

- The ED team has access to isolation rooms which meet relevant design standards, equipped with negative ventilation and dedicated bathroom facilities, to allow isolation of patients with suspected contagious illnesses.
- The ED team has a process to alter patient flow through the department in situations that may lead to epidemic infections.
- The ED has been designed with optimal ventilation and air filtration systems.

Intent

The ED provides a safe environment that will cater to the needs of different patient groups and to the needs of the ED team members.

Adequate facilities are provided for patients and visitors including seating, toilets, areas for families to gather, areas for rest, reflection, prayer.

Intent
 The ED provides a safe environment that will cater to the needs of different patient groups and to the needs of the ED team members.

The ED team has access to required and functional medical equipment.

- The ED team has a regular review process which documents equipment to ensure it is fit for use in the ED.
- The ED team, including both medical and nursing, is involved in the review and audit of equipment.
- The ED team has a process to plan for the purchase of equipment.
- The ED team shall ensure that all staff members are trained in the use of new or replacement equipment used in the ED and if required credentialed in its use.
- Cognitive aids are available to minimise risk of error.

Intent

The ED provides safe and effective resources for the ED team, including the provision of medical equipment that is well maintained for comprehensive acute patient care.

Patient data that is collected and retained is accurate and reliable, and maintained in a safe and secure manner, and is accessible by the ED team.

- The ED team ensures data is matched to the correct patient.
- The ED team utilises electronic health records where available.
- The ED team maintains patient information in a safe and secure manner, ensuring privacy of information.
- The ED patient information management system complies with relevant privacy legislation.
- The ED team utilises a patient alert system for information regarding relevant patient issues.

Intent

The ED maintains a contemporary information system to support the management of patient information and for reporting and monitoring.

Data that is collected and recorded is accurate and reliable and is utilised to support regular monitoring and reporting for program evaluation.

- The ED team ensures that information recorded is accurate and reliable.
- The ED team ensures that a minimum data set is recorded for patients which complies with relevant jurisdictional requirements.
- The ED team ensures recorded data is reliable and reflects the patient journey through the ED.

Intent

The ED maintains a contemporary information system to support the management of patient information and for reporting and monitoring.

Information technology (IT) utilised in the ED is maintained to perform optimally, enabling the best possible communication mechanisms for the ED team both within the hospital and external to the hospital, as well as ensuring information systems are secure and effective.

- The ED team engages with the hospital IT service to ensure information management systems are sensitive to ED needs.
- The ED team communicates with the hospital IT service and hospital administration to ensure systems are in place and maintained.
- The ED team has access to emergency IT support and repairs at all times.
- The ED team utilises IT services to enhance communication between departments and other hospitals or healthcare providers.
- Hospital IT teams are vigilant in ensuring IT systems cybersecurity.

Intent

The ED maintains a contemporary information system to support the management of patient information and for reporting and monitoring.

The ED team have access to adequate resources for obtaining information and data that will support the treatment of patients presenting to the ED.

- The ED team has access to computer terminals which have adequate speed and internet access in all clinical and non-clinical areas.
- The ED team has open access to information resources including relevant guidelines, handbooks, journals, and the internet.
- The ED team is able to access such information on mobile devices.
- The ED team can access monitors for primary and secondary image review and a system to view images obtained externally in other formats.

Intent

The ED maintains a contemporary information system to support the management of patient information and for reporting and monitoring.

- The ED team encompasses a range of clinical and non-clinical staff to match the department's needs.
- The ED team ensures that stewardship of the department's workforce involves reliable planning and management for current and future needs, including providing surge capacity, and supporting other sites within a healthcare network.
- The composition of the ED team supports the necessary clinical and clinical support functions of the ED, including quality assurance, education provision, administration, research, maintenance, security, cleaning.
- The ED team supports diversity in recruitment for all staff roles, ideally reflecting the composition of local communities.

Intent

The ED workforce is monitored to ensure the provision of appropriate skill mix, expertise, and competency to match the department's workload and case mix. The ED workforce is well supported by hospital management and administration.

Defining clinical support roles and responsibilities

In 2016, ACEM was reviewing our ED accreditation, while the Australian Commission on Safety and Quality in Health Care (ACSQHC) was reviewing our hospital accreditation. We were looking for a way to demonstrate a comprehensive approach to quality and safety by senior emergency staff.

As a newly ACEM-accredited regional ED, we were still struggling to explain to hospital administrators the importance of clinical support time.

We needed to explain to ourselves and others how our clinical support time would enhance quality and safety in the emergency department.

We used the inaugural Quality Standards to assign and define our clinical support roles and responsibilities.

Some senior doctors already had defined clinical support roles, such as the Director of Emergency Medicine Training (DEMT), but others did not. There were also areas with no senior doctor assigned to them.

Roles were assigned through group and individual meetings. Every sub-section of the Quality Standards was assigned to someone.

The results were displayed on a mind map. Specific local projects (such as a sepsis project with short term funding) were also included on the diagram.

As part of this initiative, we audited our department against the entire Quality Standards document.

The most useful outcome was a clearer understanding by the hospital's administration of the importance of clinical support time.

The document also helped the ED Director and senior doctors understand their responsibilities.

The document and process were favourably received by ACEM reviewers.

However, the process took many hours of senior doctor's time and, like many quality improvement activities, it was not maintained after the review process finished and key personnel changed.

The Quality Standards can help a newly accredited department explain to hospital administrators how clinical support time for senior doctors improves quality and safety.

The streamlined new edition of the Quality Standards should make distribution of roles and auditing easier.

Turnover of ED team members is monitored and any significant change to the rate of turnover is investigated.

- The ED team has a system to monitor turnover rates and sick leave utilisation.
- 'Presenteeism' during illness is monitored as well as absenteeism rates.
- Significant increases observed in turnover are reported to the ED team and hospital management.
- The ED team is involved in any investigation of increased turnover, including conducting exit interviews.
- Turnover is minimised by system level interventions aimed at improving workforce experience.
- The ED team monitors absences to observe for signs of stress in the workforce.

Intent

The ED workforce is monitored to ensure the provision of appropriate skill mix, expertise, and competency to match the department's workload and case mix. The ED workforce is well supported by hospital management and administration.

- Occupational Health and Safety (OHS) representatives are supported and easy to contact.
- Effective safety reporting systems are available.
- Psychological safety is supported as well as physical safety.
- There is strong safety leadership within the ED and the broader hospital that contributes to a positive safety culture, resulting in improved worker safety behaviours.
- The ED team advocates for the ED to be a safe and secure environment for team members.
- The ED team ensures team members have access to evidence-based counselling, for work related stresses.
- The ED team has access to relevant training for their work tasks and safety requirements, including assessments of competency.
- The ED team has systems in place where staff are regularly consulted in relation to how work is conducted and departmental health and safety issues.
- The ED team is provided with information about potential risks associated with their work, the safety policies and procedures in place and how to work safely and deal with workplace emergencies.
- The ED has systems in place to identify, assess and control both physical and psychological risks of harm in the workplace.
- There are processes in place for identifying, assessing and controlling physical, psychological and psychosocial hazards and risks e.g. fatigue, high workloads, emotional demands, traumatic events, occupational violence, bullying and harassment, manual tasks.

Intent

The ED team has a healthy workplace plan which encourages the pursuit of health and wellbeing for team members. This includes providing education and training in achieving a healthy lifestyle and participating in preventative and health improvement initiatives.

Improving staff morale

Our ED had a problem with low staff morale. There were episodes of conflict between senior staff in clinical spaces, and disrespectful behaviours.

We began with a focus on senior ED doctors – as a group, there are clear expectations of their leadership in the department.

Our approach included:

- ▶ Distributing a senior ED doctor staff satisfaction survey.
- ▶ Running a series of sessions exploring the benefits of a healthy culture and the negative impacts of a poor culture.
- ▶ Organising social occasions outside the workplace for senior doctors.
- ▶ Arranging for the senior ED doctors to develop a set of Senior ED Doctor Values with descriptors.
- ▶ Launched these values at a dinner for senior doctors.

These measures led to greater pride in working together in the ED, and a shared understanding of the benefit of agreed values. The doctors demonstrated and role-modelled respectful behaviours, and morale improved.

However, one outcome of this approach was that other ED staff (nursing, allied health and administrative staff) felt left out or devalued, so we are now working with these groups too. It's likely that common values will be adopted across the whole department.

The experience taught us the importance of a 'bottom-up' process to develop ownership of meaningful values, and that this process takes time. These steps took 18 months to complete but it was time well invested.

We also learned that not every staff member will engage or overtly support these cultural changes but will often align with them.

When it comes to workplace culture change, it's also important to consider all groups of staff from the outset.

Case study

The ED team has a wellbeing policy which reflects support for the ED team as a priority.

Our emergency department (ED) was experiencing increased pressures caused by access block, ambulance ramping and COVID-19, intensifying our already challenging work environments.

Without a strategic plan to prioritise staff wellbeing, it was difficult to embed the processes into the day-to-day work that we do.

We have developed a staff wellbeing strategic plan to improve the wellness within amongst our ED staff.

When developing the processes for the strategic plan, we involved various groups within our ED including FACEMs, trainees, nurses, orderlies and administrative staff.

The plan focused on including some core processes that were part of the everyday work we do. This included activities that promote social networking, physical fitness (external to the workplace), teamwork and staff morale.

Each item/activity within the strategic plan has positively impacted the department's culture. We have found it to be a very inclusive experience, as everyone has been invited to be involved, and staff across the department have been involved in contributing.

The strategy has contributed to creating a culture that focuses on wellbeing. Our staff morale has increased, and the introduction of activities has assisted with mitigating some of the team's stressors (mental and physical).

We continue to identify issues and/or new opportunities to improve the wellbeing of staff so the strategic plan is an evolving piece of work.

- The ED team has a healthy workplace plan which encourages the pursuit of health and wellbeing for team members including providing education and training in achieving a healthy lifestyle and participating in preventative and health improvement initiatives.
- There are processes in place to monitor staff wellbeing, provide early intervention, and referral to appropriate support.
- The ED has facilities to support a healthy lifestyle, for example showers, lockers and bike storage racks, access to healthy food options.
- The ED team has close access to facilities for breaks including meals, prayer, rest, and reflection.
- The ED team supports links with mentoring programs.
- The ED team encourages team members to seek support and utilise available resources for debriefing or discussion when required.
- The ED team supports team members to access an employee assistance program if needed.
- The ED team advocates for team members to have their own primary care practitioner, independent of the work team.

Intent

The ED team encourages team members to seek support and utilise available resources for debriefing or discussion when required.

Prior to the initiative we undertook, ED staff were required to source their own support following a critical or confronting incident. This was often something that the staff did not action themselves. As part of any critical incident, organisational governance would review the incident and consider measures to prevent/limit it from occurring again. However no specific support would be offered to the ED staff member/s involved in the incident. Any support that was eventually offered, was not done in a timely manner.

To improve staff safety and wellbeing, we decided to establish a robust Peer Support Program. This program included:

- ▶ Establishing a group of volunteers consisting of FACEMs and senior nursing staff, responsible for assisting ED staff navigate the debriefing procedures, following involvement in a critical or confronting incident.

- ▶ Opportunities for the staff member to accept or decline the approach/being contacted.
- ▶ Providing an opportunity to have an initial debrief and talk about the impacts of the incident.
- ▶ Providing avenues of support such as private counselling, seeking support from their GP or the staff care clinic.

This Peer Support Program allowed staff to deal with the impacts of a critical or confronting incident at the time (within 24 to 48 hours) and provided them the opportunity to reflect, restore and potentially recover before returning to the workplace.

Implementing a debriefing process following critical incidents

In a workplace wellbeing survey, staff indicated that “debriefing” may be a way to improve their personal resilience. Following discussions among our team, we thought “hot debriefs” (team debriefing immediately after a critical incident) may be the way forward.

We looked at initiatives colleagues in other departments had implemented, reviewed relevant literature and asked colleagues further questions about this. We then developed a plan of action, as to what initiative we wanted to roll out – which was the ‘hot debrief’.

To facilitate this debriefing process, we produced a hot debrief form. This consisted of a series of statements and questions and can be used by any member of the team to lead the hot debrief. The form is available on the hospital intranet site, and ready to be used at a moment’s notice.

This initiative has had a very positive impact on staff. It has been useful to confirm that all staff involved in a critical incident are managing ok. The process has also stimulated discussion where staff had uncertainties about the critical incident and required clarification. Importantly the ‘hot debrief’ process has been used to identify various safety and quality issues e.g. equipment such as phones are not working, medications not available.

Whilst we have started using the ‘hot debriefs’, we also need to start monitoring to ensure they are being used after every critical incident, and this will be the next stage of implementation.

This has also been a constructive activity for the ED team to undertake. Seemingly small initiatives can take a long time and significant effort in order to see change. We found it critical to establish both top-down and bottom-up support for this initiative. Our trainees in particular have found these ‘hot debriefs’ helpful and an additional support to their training experience, and are keen to ensure that this initiative remains a long-term activity for the ED.

Implementation of staff social activities

We identified that there were high levels of stress among ED staff (both mental and physical).

In response to identifying an interest within the ED, we have established several sports and active/exercise groups including running, swimming, biking and hiking. All new staff are encouraged to get involved, whether they are familiar or new to these activities.

We have utilised available space within the ED to accommodate exercise equipment storage e.g. bike racks. This has been particularly useful in encouraging engagement in exercise activities.

The use of exercise groups has seen enormous benefit to ED staff. It has increased staff comradery and encouraged team building, resulting in more cohesion amongst staff.

The ED team is in close communication with hospital administration and other hospital departments, nurturing relationships to ensure the provision of a timely and safe service.

- The ED team engages with hospital administration and other hospital departments to enhance communication and accountability, and improve quality, safety, and efficiency of care.
- The ED team ensures there is transparency in the implementation of practices and policies.
- The ED team promotes an approach where the ED integrates with other hospital processes such as inpatient units and diagnostic services to achieve good patient care.
- The ED team members and hospital administration team clearly understand and are trained to deliver specific accountabilities and leadership responsibilities.
- The ED team and hospital administration encourage a process of patient engagement.

Intent

The ED team has regular access to the executive level of governance through reporting and feedback mechanisms.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Addressing professional disputes

We identified that there were high levels of frustration amongst staff, arising from disputes and grievances resulting from interactions with staff both within the ED and from other departments of the hospital. This was impacting staff morale, timeliness of patient care and effective teamwork.

We created a disputes logbook to catalogue the issues which arise on each shift, to facilitate formal review in a time that was less stressful and/or more productive for the staff involved.

All staff are now actively participating in this logbook process.

We found that it allowed staff to focus on their work in a more effective manner, knowing that any disputes or grievances would be addressed at a later, more appropriate time.

The use of conflict resolution resulting from logbook entries has also significantly reduced the number of logged issues. Staff have reported less frustration following a dispute and/or grievance, allowing them to move on from the issue and onto the next task or patient.

Defining clinical support roles and responsibilities

In 2016, ACEM was reviewing our ED accreditation, while the Australian Commission on Safety and Quality in Health Care (ACSQHC) was reviewing our hospital accreditation. We were looking for a way to demonstrate a comprehensive approach to quality and safety by senior emergency staff.

As a newly ACEM-accredited regional ED, we were still struggling to explain to hospital administrators the importance of clinical support time.

We needed to explain to ourselves and others how our clinical support time would enhance quality and safety in the emergency department.

We used the inaugural Quality Standards to assign and define our clinical support roles and responsibilities.

Some senior doctors already had defined clinical support roles, such as the Director of Emergency Medicine Training (DEMT), but others did not. There were also areas with no senior doctor assigned to them.

Roles were assigned through group and individual meetings. Every sub-section of the Quality Standards was assigned to someone.

The results were displayed on a mind map. Specific local projects (such as a sepsis project with short term funding) were also included on the diagram.

As part of this initiative, we audited our department against the entire Quality Standards document.

The most useful outcome was a clearer understanding by the hospital's administration of the importance of clinical support time.

The document also helped the ED Director and senior doctors understand their responsibilities.

The document and process were favourably received by ACEM reviewers.

However, the process took many hours of senior doctor's time and, like many quality improvement activities, it was not maintained after the review process finished and key personnel changed.

The Quality Standards can help a newly accredited department explain to hospital administrators how clinical support time for senior doctors improves quality and safety.

The streamlined new edition of the Quality Standards should make distribution of roles and auditing easier.

Case study 3

Addressing professional disputes

We identified that there were high levels of frustration amongst staff, arising from disputes and grievances resulting from interactions with staff both within the ED and from other departments of the hospital. This was impacting staff morale, timeliness of patient care and effective teamwork.

We created a disputes logbook to catalogue the issues which arise on each shift, to facilitate formal review in a time that was less stressful and/or more productive for the staff involved.

All staff are now actively participating in this logbook process.

We found that it allowed staff to focus on their work in a more effective manner, knowing that any disputes or grievances would be addressed at a later, more appropriate time.

The use of conflict resolution resulting from logbook entries has also significantly reduced the number of logged issues. Staff have reported less frustration following a dispute and/or grievance, allowing them to move on from the issue and onto the next task or patient.

Emergency care is provided by a wide range of providers and facilities working within supportive and collaborative networks.

- The ED is part of an established emergency medicine (EM) network.
- Specialist support, advice and training is provided to non-specialist providers within this network.
- Retrieval, patient transport, disaster planning, governance, research, education, and training is coordinated throughout the EM network.
- Where possible, the EM network works to minimise workforce maldistribution.

Intent

The ED team has regular access to the executive level of governance through reporting and feedback mechanisms.

Case study

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

The ED team engages with a range of primary care providers and community and disability services to support optimal patient care beyond the acute episode of care provided in the ED.

- The ED team works within a network of hospitals to share support and engagement.
- The ED team endeavours to interact with local primary care providers.
- The ED team engages with First Nation and multicultural primary care providers.
- The ED team supports the interface with GP networks or primary health networks to enhance communication at acute presentation and discharge.
- The ED team recognises the importance of the transfer of care between acute and primary settings.
- The ED team has established communication mechanisms with community and primary care providers to enhance presentation, admission, and discharge processes.

Intent

The ED team has regular access to the executive level of governance through reporting and feedback mechanisms.

The ED team and hospital leadership focus on improving patient experience by providing high quality care in addition to being responsive to patient, carer and consumer input and needs.

- The ED team has a mechanism to offer patients the opportunity to provide feedback regarding satisfaction and experience of care received.
- The ED works to act on feedback given by patients and the community to ensure responsive quality improvement initiatives in the ED.
- The ED team provides culturally safe avenues for feedback to patients, their family or carer.
- The ED team provides a culturally safe environment and empowers patients, their family or carer to take full advantage of the health care service offered.
- The ED team has a process to access cultural liaison officers, and they feel safe and welcomed in the ED as part of the team.
- The ED team has access to consumer representatives to engage in quality assurance and improvement activities.

Intent

The ED team has regular access to the executive level of governance through reporting and feedback mechanisms.

Legislation / regulation

The ED team implements consistent models of care, such as resuscitation, acute and subacute care, fast track.

- The ED team reviews the models of care routinely to ensure they meet the needs of patients presenting to the ED.
- The models of care are consistent with the department's capacity and ED team members' skills.
- The ED team utilises mechanisms to share information about successful models of care.

Intent

Patient flow through the ED is supported by the utilisation of effective models of care, streaming models, staffing levels to match workload, hospital admission and discharge practices, and coordinated whole-of-hospital responses to ED overcrowding.

The ED team ensures streaming of patients is an effective and safe mechanism to enhance patient flow.

- The ED team advocates for safe and timely access to the ED and hospital for all patients.
- The hospital and ED team has established systems to enhance patient flow through the ED and inpatient units, including criteria for direct admission and use of acute assessment and diagnostic units where available.
- The hospital and ED team has used best practice and evidence to establish these systems.
- The ED team works together to support consistent patient flow practices.
- The ED team establishes communication mechanisms with ambulance services, other specialties, and inpatient departments to enhance patient flow through the department.
- The ED team advocates against patients being managed or left to wait in hallways, corridors, or ambulance bays.

Intent

Patient flow through the ED is supported by the utilisation of effective models of care, streaming models, staffing levels to match workload, hospital admission and discharge practices, and coordinated whole-of-hospital responses to ED overcrowding.

Legislation / regulation

When resourcing and capacity do not match demand for inpatient services, access block may occur, resulting in ED overcrowding and delays in transferring care of patients from ambulance services.

Predictable surges in presentations such as seasonal outbreaks of respiratory illness or unpredictable demand pressures such as a disaster may also result in ED overcrowding.

Patient care may be compromised when ED overcrowding occurs.

- Rostering of the ED team takes into account anticipated times of increased demand.
- The ED team and hospital or EM network executive teams have established processes for identifying, escalating, and responding to ED overcrowding and episodes of capacity and demand mismatch.
- The ED team participates in whole-of-hospital responses to increased demand and reduced hospital capacity.

Intent

Patient flow through the ED is supported by the utilisation of effective models of care, streaming models, staffing levels to match workload, hospital admission and discharge practices, and coordinated whole-of-hospital responses to ED overcrowding.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Improving the recognition, triage and management of trauma patients, especially those over 70

We identified a number of problems with managing trauma presentations in our ED.

These included an under-recognition of the number of trauma presentations and their patient pathways. Many of these presentations were elderly people aged over 70. This age group made up 70% per cent of all trauma patients in the ED, and had a mortality rate of 10%.

There was also a high level of under-triaging of blunt chest injuries in these older patients, with an associated lack of formal and standardised trauma triage, management and referral pathways.

Our approach to this problem included:

- ▶ Development of formal trauma triage and trauma response charts.
- ▶ A review and update of blunt chest injury guidelines.
- ▶ Trauma education (online learning modules, face-to-face training, simulation).
- ▶ Initiating a Trauma Special Interest Group for ED medical and nursing staff.
- ▶ Creation of a hospital Trauma Committee.

These measures achieved:

- ▶ Increased awareness and early recognition of trauma presentations, especially trauma in elderly people.
- ▶ The establishment of standardised triage, assessment and management, and referral pathways.
- ▶ Ongoing trauma-related education (i.e. Philadelphia collar training for nursing staff).
- ▶ Hospital-wide collaboration and ongoing improvement of trauma care.

We also learned that, despite not being a dedicated trauma service, our hospital has a significant case load of trauma presentations. These include many elderly patients with comorbidities and an increased risk of morbidity and mortality.

The improvement of trauma care requires a hospital-wide approach with ongoing work to maintain it, along with support and commitment from the organisation.

Defining clinical support roles and responsibilities

In 2016, ACEM was reviewing our ED accreditation, while the Australian Commission on Safety and Quality in Health Care (ACSQHC) was reviewing our hospital accreditation. We were looking for a way to demonstrate a comprehensive approach to quality and safety by senior emergency staff.

As a newly ACEM-accredited regional ED, we were still struggling to explain to hospital administrators the importance of clinical support time.

We needed to explain to ourselves and others how our clinical support time would enhance quality and safety in the emergency department.

We used the inaugural Quality Standards to assign and define our clinical support roles and responsibilities.

Some senior doctors already had defined clinical support roles, such as the Director of Emergency Medicine Training (DEMT), but others did not. There were also areas with no senior doctor assigned to them.

Roles were assigned through group and individual meetings. Every sub-section of the Quality Standards was assigned to someone.

The results were displayed on a mind map. Specific local projects (such as a sepsis project with short term funding) were also included on the diagram.

As part of this initiative, we audited our department against the entire Quality Standards document.

The most useful outcome was a clearer understanding by the hospital's administration of the importance of clinical support time.

The document also helped the ED Director and senior doctors understand their responsibilities.

The document and process were favourably received by ACEM reviewers.

However, the process took many hours of senior doctor's time and, like many quality improvement activities, it was not maintained after the review process finished and key personnel changed.

The Quality Standards can help a newly accredited department explain to hospital administrators how clinical support time for senior doctors improves quality and safety.

The streamlined new edition of the Quality Standards should make distribution of roles and auditing easier.

The ED team participates in effective incident management and investigation, including reporting, investigating, and analysing incidents, which results in system improvements.

The culture of incident reporting is one without blame and supports team members to notify events.

- The ED team has an understanding of adverse and near miss events.
- The ED team recognises the occurrence of an adverse event and responds effectively to mitigate harm to the patient.
- The ED team has an understanding of open disclosure and are supported to use it where relevant.
- The ED team supports a culture of incident reporting that is without blame and encourages team members to report incidents that occur.
- The ED team has a process to provide care and support to the patient, their family or carer as well as health care professionals affected by an event and subsequent investigation.
- The ED team reports incidents in compliance with hospital, and where relevant, jurisdictional, processes. The ED team encourages the use of local and jurisdictional notification systems and the ACEM Emergency Medicine Events Register (EMER).
- The ED team participates in adverse event analysis, participating in the development and implementation of appropriate recommendations for improvement. The ED team utilises reported incidents as learning and training tools.
- The ED team ensures that team members involved with adverse incidents have sufficient knowledge of supports available to them throughout the process.

Intent

The ED team strives to provide safe care for all patients through the provision of culturally safe care, by minimising and mitigating unintended harms and by having robust patient safety systems.

The ED team have processes in place for managing aspects of patient safety including adverse incidents, patient feedback and complaints, risk management, quality assurance, education on patient safety and human factors topics.

Improving awareness of patient safety principles in the ED

There was a need to improve awareness of patient safety principles in the ED. The understanding of these principles was patchy, leading to a failure to address significant contributory factors in adverse events analyses.

We provided more education for staff in the following ways:

- ▶ ED staff completed Patient Safety (HEAPS) and Root Cause Analysis (RCA) training.
- ▶ Topics such as human factors, cognitive bias, speaking up, and safe team behaviours were included in trainee and nursing education.
- ▶ Clear descriptions of contributory factors and relevant cognitive biases were included in all multidisciplinary Mortality and Morbidity presentations.
- ▶ Initiation of Learning from Cases education sessions, with a focus on human factors.
- ▶ Introduction of 'amazing and awesome' cases into the Mortality and Morbidity meetings, focusing on what team and situational factors contributed to optimal patient outcomes.

The impact of this was:

- ▶ Greater awareness of human factors and cognitive biases, and their impact on patient diagnoses, care and outcomes.
- ▶ Better identification of associated contributory factors in adverse events analysis, with the development of stronger recommendations to prevent the same things happening again.
- ▶ Elimination of individual blame for when things go wrong – staff are now able to view errors through a complex system lens.
- ▶ Greater engagement in clinical incident analyses and finding solutions to problems.

We learned from this process that:

- ▶ Staff are eager to learn new skills and willing to implement them, especially when they can identify with their own human factors and biases.
- ▶ A multidisciplinary approach to identifying contributory factors and developing recommendations after adverse events delivers a richer analysis and understanding of why things go wrong, along with stronger and more effective practice change.

The ED has clinical risk management systems to enhance the quality and safety of patient care.

- The ED team has processes to support the ED team to recognise, respond and report risks.
- The ED team has systems to implement and analyse improvements in response to identified risks at a patient and departmental level and obtains feedback on the analysis of reported risks.
- The ED team ensures that risk management processes are reviewed at the highest level of governance in the organisation.
- The ED team supports patients in reporting risks.

Intent

The ED team strives to provide safe care for all patients through the provision of culturally safe care, by minimising and mitigating unintended harms and by having robust patient safety systems.

The ED team have processes in place for managing aspects of patient safety including adverse incidents, patient feedback and complaints, risk management, quality assurance, education on patient safety and human factors topics.

Improving awareness of patient safety principles in the ED

There was a need to improve awareness of patient safety principles in the ED. The understanding of these principles was patchy, leading to a failure to address significant contributory factors in adverse events analyses.

We provided more education for staff in the following ways:

- ▶ ED staff completed Patient Safety (HEAPS) and Root Cause Analysis (RCA) training.
- ▶ Topics such as human factors, cognitive bias, speaking up, and safe team behaviours were included in trainee and nursing education.
- ▶ Clear descriptions of contributory factors and relevant cognitive biases were included in all multidisciplinary Mortality and Morbidity presentations.
- ▶ Initiation of Learning from Cases education sessions, with a focus on human factors.
- ▶ Introduction of 'amazing and awesome' cases into the Mortality and Morbidity meetings, focusing on what team and situational factors contributed to optimal patient outcomes.

The impact of this was:

- ▶ Greater awareness of human factors and cognitive biases, and their impact on patient diagnoses, care and outcomes.
- ▶ Better identification of associated contributory factors in adverse events analysis, with the development of stronger recommendations to prevent the same things happening again.
- ▶ Elimination of individual blame for when things go wrong – staff are now able to view errors through a complex system lens.
- ▶ Greater engagement in clinical incident analyses and finding solutions to problems.

We learned from this process that:

- ▶ Staff are eager to learn new skills and willing to implement them, especially when they can identify with their own human factors and biases.
- ▶ A multidisciplinary approach to identifying contributory factors and developing recommendations after adverse events delivers a richer analysis and understanding of why things go wrong, along with stronger and more effective practice change.

The ED team applies core patient safety knowledge, skills, and attitudes to everyday work.

The ED team works within inter-professional teams to improve patient safety and quality of care in the ED.

- The ED team ensures an understanding of key patient safety concepts and processes.
- The ED team seeks to apply, disseminate, and share patient safety principles, behaviours and knowledge within the ED environment.
- The ED team works within its own limitations to ensure a culture of patient safety.
- The ED team participates in shared inter-professional team learning.
- Educational curricula include teaching about human factors, including cognitive bias, diagnostic errors, minimising error, graded assertiveness, optimising human performance.
- The ED team demonstrates a capacity to learn from everyday successes as well as from adverse events.

Intent

The ED team strives to provide safe care for all patients through the provision of culturally safe care, by minimising and mitigating unintended harms and by having robust patient safety systems.

The ED team have processes in place for managing aspects of patient safety including adverse incidents, patient feedback and complaints, risk management, quality assurance, education on patient safety and human factors topics.

Improving awareness of patient safety principles in the ED

There was a need to improve awareness of patient safety principles in the ED. The understanding of these principles was patchy, leading to a failure to address significant contributory factors in adverse events analyses.

We provided more education for staff in the following ways:

- ▶ ED staff completed Patient Safety (HEAPS) and Root Cause Analysis (RCA) training.
- ▶ Topics such as human factors, cognitive bias, speaking up, and safe team behaviours were included in trainee and nursing education.
- ▶ Clear descriptions of contributory factors and relevant cognitive biases were included in all multidisciplinary Mortality and Morbidity presentations.
- ▶ Initiation of Learning from Cases education sessions, with a focus on human factors.
- ▶ Introduction of 'amazing and awesome' cases into the Mortality and Morbidity meetings, focusing on what team and situational factors contributed to optimal patient outcomes.

The impact of this was:

- ▶ Greater awareness of human factors and cognitive biases, and their impact on patient diagnoses, care and outcomes.
- ▶ Better identification of associated contributory factors in adverse events analysis, with the development of stronger recommendations to prevent the same things happening again.
- ▶ Elimination of individual blame for when things go wrong – staff are now able to view errors through a complex system lens.
- ▶ Greater engagement in clinical incident analyses and finding solutions to problems.

We learned from this process that:

- ▶ Staff are eager to learn new skills and willing to implement them, especially when they can identify with their own human factors and biases.
- ▶ A multidisciplinary approach to identifying contributory factors and developing recommendations after adverse events delivers a richer analysis and understanding of why things go wrong, along with stronger and more effective practice change.

The ED has a disaster management system to direct, control and coordinate response and recovery situations.

- The ED team or network has an established disaster management plan which is regularly updated and practised.
- The ED disaster management plan describes specific organisational roles, titles, and responsibilities for each incident management function.
- The ED team is aware of any expectations for providing a team to deliver care outside the hospital.
- The ED team establishes applicable policies and procedures for coordinating response, continuity, and recovery activities.
- The ED team has a clear process for leadership in the case of an emergency.
- The ED team is aware of emergency and disaster management plans.
- The ED team has a process for a whole hospital system approach to emergency/disasters.
- The ED team has a clear communication link with community emergency services such as police, fire, and ambulance, and regularly practises disaster management plans.
- The ED team has systems in place to ensure safe management of vulnerable patient groups during disasters.
- The ED team has systems in place to assist disaster affected team members and patients in managing associated distress or stress, including the provision of mental health advice.

Intent

The ED team is supported to adapt normal work processes when faced with temporary or sustained increased workload.

The ED has a plan to manage increased demand during seasonal or non-sustained periods of disease outbreak.

- The ED team has a mechanism to respond to the widespread occurrence of an infectious disease in a community.
- The ED team or network has a plan to increase its workforce to respond to epidemic outbreak of disease.
- The ED team has a process to document information and decisions during the event of an epidemic.
- The ED has a plan to identify, isolate and or manage people who may have highly contagious diseases presenting to the ED in designated areas of the ED so as to reduce potential cross infection to ED team members, other patients or members of the general public.
- The ED team has systems in place to promptly identify notifiable and/or other symptom complex presentations that might indicate a cluster disease outbreak for which State Health Departments should be notified.

Intent

The ED team is supported to adapt normal work processes when faced with temporary or sustained increased workload.

Domain 3 / Professionalism

Intent ▶ The professional domain focuses on the professional attributes of the ED team as well as the legal and ethical obligations encountered in the provision of care within the ED. It encompasses the professional standing of ED team members and provides some elements for the delivery of quality care within the community and whole hospital system.

Improving staff morale

Our ED had a problem with low staff morale. There were episodes of conflict between senior staff in clinical spaces, and disrespectful behaviours.

We began with a focus on senior ED doctors – as a group, there are clear expectations of their leadership in the department.

Our approach included:

- ▶ Distributing a senior ED doctor staff satisfaction survey.
- ▶ Running a series of sessions exploring the benefits of a healthy culture and the negative impacts of a poor culture.
- ▶ Organising social occasions outside the workplace for senior doctors.
- ▶ Arranging for the senior ED doctors to develop a set of Senior ED Doctor Values with descriptors.
- ▶ Launched these values at a dinner for senior doctors.

These measures led to greater pride in working together in the ED, and a shared understanding of the benefit of agreed values. The doctors demonstrated and role-modelled respectful behaviours, and morale improved.

However, one outcome of this approach was that other ED staff (nursing, allied health and administrative staff) felt left out or devalued, so we are now working with these groups too. It's likely that common values will be adopted across the whole department.

The experience taught us the importance of a 'bottom-up' process to develop ownership of meaningful values, and that this process takes time. These steps took 18 months to complete but it was time well invested.

We also learned that not every staff member will engage or overtly support these cultural changes but will often align with them.

When it comes to workplace culture change, it's also important to consider all groups of staff from the outset.

Faster relief for patients with abdominal pain – nurse initiated analgesia

We found that patients presenting with abdominal pain to the Emergency Department had to wait too long for pain relief other than paracetamol, e.g.

Triage Category 4 with abdominal pain. Time to analgesia = **147 minutes**

Triage Category 3 with abdominal pain. Time to analgesia = **100 minutes**

There was also no existing hospital policy for nurses to initiate medication.

Our solution was to develop and implement the Nursing Initiated Analgesia Project. This focussed on collaboration between ED nursing staff and the ED pharmacy to develop ED-specific guidelines on nurse-initiated analgesia. This initiative reduced the time between patients presenting to ED with abdominal pain and receiving pain relief.

What we learned from this process is that abdominal pain presentations are very common in ED and need prompt intervention with effective analgesia.

We also identified some barriers that make it harder for nurses to work effectively. These included having a high triage nurse workload and the importance of the early application of formal pain scores.

- The ED team does not take advantage of any patient.
- The ED team does not make decisions for personal gain.
- The ED team ensures that interactions with pharmaceutical, medical equipment or clinical supply companies, or other entities that may pose a conflict of interest, comply with relevant guidelines.
- The ED team ensures there is no inappropriate personal use of hospital resources.
- The ED team ensures there is a process to refer to another clinician in cases of moral objections.
- The ED team refrains from inappropriate conduct toward or discussion about colleagues.
- The ED team has processes available for addressing unprofessional conduct.

Intent

The ED team works together optimally as a high reliability organisation.

The ED team utilise an ethical framework to guide decision-making. Fundamental premises include:

- ▶ Every person matters and every person deserves respect.
- ▶ We never abandon a patient: care is never futile though treatment may be.

Personal bias is checked prior to and during decision-making.

Well-known and ethically rigorous principles are used to guide decision-making – autonomy, beneficence, non-maleficence, justice.

In times of resource scarcity, an objective, evidence-based threshold test is available to guide decision-making to ensure consistency and reduce latent bias.

Intent

Members of the ED team comply with the professional, legal, and ethical obligations required by law (and relevant professional organisations) within the boundaries of their knowledge, skills and competence.

Day to day conduct of the ED team complies with principles and requirements of relevant legislative and regulatory standards.

- The ED team is aware of the principles of preservation and collection of forensic evidence.
- Contemporaneous documentation of injuries is made to assist with potential judicial processes.
- Formal processes must be adhered to when providing reports to the police or legal authorities.
- The ED team ensures that a police report template is available to assist team members when required.
- The ED team ensures that support, from senior team members or legal practitioners, is available for team members who are required to write a police report or when subpoenaed to court as a witness.
- Staff involved in legal processes should be supported in case of emotional or mental distress and provided with opportunity to talk with a mental health professional, counsellor, advocate, or carer.

Intent

Members of the ED team comply with the professional, legal, and ethical obligations required by law (and relevant professional organisations) within the boundaries of their knowledge, skills and competence.

Legislation / regulation

- The ED team understands legal principles in situations where patients lack capacity.
- The ED team is trained to assess a patient's competence to make relevant treatment decisions.
- The ED team respects the competent patient's right to accept or reject advice and to make their own decisions about treatment procedures.
- The ED team is aware of processes to obtain consent for non-emergency treatment according to the relevant jurisdictional hierarchy of consent.
- The ED team has a process to negotiate conflict between family members or between jurisdictional or cultural definitions of next of kin.
- The ED team is aware of the process of providing emergency treatment if a patient is not competent.
- The ED team is aware of their duty of care obligations under local legislation or regulations.

Intent

Members of the ED team comply with the professional, legal, and ethical obligations required by law (and relevant professional organisations) within the boundaries of their knowledge, skills and competence.

- The ED team is trained and complies with relevant mental health legislation and regulations, including relevant notification requirements.
- The ED team provides clinical care in compliance with relevant jurisdictional mental health legislation including observing least restrictive practice approaches.
- The ED team clearly communicates the requirements of relevant mental health legislation to the patient.

Intent

Members of the ED team comply with the professional, legal, and ethical obligations required by law (and relevant professional organisations) within the boundaries of their knowledge, skills and competence.

- The ED team complies with the requirements for patient privacy and confidentiality under the relevant legislation for the jurisdiction.
- The ED team clearly communicates privacy and confidentiality requirements to patients with consideration to health literacy and cultural differences.
- The ED team is sensitive to all information discussed in the ED.

Intent

Members of the ED team comply with the professional, legal, and ethical obligations required by law (and relevant professional organisations) within the boundaries of their knowledge, skills and competence.

ED interaction with the media is in compliance with relevant privacy and confidentiality legislation and principles, as well as with hospital policy, to ensure the department is represented and that patients continue to receive quality care.

- The ED team ensures interaction with the media is in compliance with relevant privacy and confidentiality standards.
- The ED team is familiar and compliant with hospital policies for media interaction.
- The ED team does not use any media modality as a communication tool about any patient, work colleague or departmental clinical activity.
- ED team members are aware of and abide by relevant policies on the use of social media.

Intent

Members of the ED team comply with the professional, legal, and ethical obligations required by law (and relevant professional organisations) within the boundaries of their knowledge, skills and competence.

The ED provides public health awareness and advocacy, illness prevention and preventive care based on patient need and best available evidence.

- The ED team participates in public health promotion and advocacy for patients.
- The ED team has procedures in place which ensure that every clinical contact is an opportunity to promote health and prevent illness or injury.
- The ED team ensures best available information is accessible by patients within the ED.
- The ED team endeavours to identify areas of health-related need within its local community.
- The ED team strives to reduce barriers to accessing healthcare for marginalised people.
- The ED team engages in information sharing for the purposes of advocacy and public awareness.
- The ED team advocates for improvements in social determinants of health for individuals and populations, and for equitable health outcomes for all.
- The ED team advocates good resource stewardship in all areas.

Intent

The ED team is responsible for providing patients and team members with advocacy relevant to their needs and available resources.

The health and wellbeing of the ED team and its members is essential to the provision of quality healthcare. A systems approach to caring for the workforce is taken by the ED leadership, as well as the promotion of individual wellbeing.

- ED leaders advocate for the psychological and physical safety and wellbeing of all team members, and work to address system factors that cause harm to the workforce.
- The ED team implements responsible rostering and work hours and supports the use of sick leave.
- The ED team supports and promotes healthy personal lifestyle choices.
- The ED team supports team members to access formal healthcare when necessary and discourages clinical team members from treating themselves or colleagues.

Intent

The ED team is responsible for providing patients and team members with advocacy relevant to their needs and available resources.

Domain 4 / Education and training

Intent ► The education and training domain includes the ongoing development and maintenance of knowledge, skills, and professional attributes. This domain includes provisions for ensuring high quality supervision of trainees and students, junior team members, which in turn enables a high quality of care to be nurtured within the department. Education and training may be provided by the department, hospital, network, or external agency.

Standard 4.1 Departmental training

Objective A	Orientation and induction are provided	>
Objective B	Inter-professional training is supported	>
Objective C	Orientation to new procedures and equipment is provided	>
Objective D	Non-technical skills training	>
Objective E	Practical support for health service mandatory training	>
Objective F	Educational needs of the ED team identification	>
Objective G	Equitable access to educational resources	>

Standard 4.2 Formal clinical education

Objective A	Access to education and training	>
Objective B	Access to clinical supervision	>
Objective C	Patient involvement	>
Objective D	Content of educational curricula	>
Objective E	Modality of delivery of training	>
Objective F	Collaboration with other agencies	>
Objective G	Reflective practice	>
Objective H	Assessment requirements	>

Standard 4.3 Ongoing training and learning

Objective A	Continuing professional development	>
Objective B	Maintenance of competency and credentialing	>
Objective C	Training as educators	>
Objective D	Training as assessors	>

Relevant training and education are routinely provided to the ED team to foster collaborative practice and teamwork.

- The ED team encourages team members to participate in inter-professional education and learning opportunities.
- The ED team demonstrates clear leadership through the provision of inter-professional education and learning.
- The ED team ensures there are mechanisms in place to respond to feedback from inter-professional learning.
- The ED team ensures that the provision of inter-professional learning opportunities results in consistent work practices and expectations amongst the ED team.

Intent

The ED team are provided training to enable participation in the day-to-day running of the department.

Replacing hard collars with soft collars for trauma patients with suspected neck injury

Trauma patients with suspected neck injury were kept in hard collars in the ED until cleared by an emergency physician, and for 25% of these patients the length of stay (LOS) was more than six hours. Despite a lack of evidence for the use of hard collars and their role in preventing further spinal cord injury, these collars were increasing patients' discomfort and their risk of aspiration. We were also seeing iatrogenic injuries in these patients due to localised pressure from the hard collar.

To improve this, we collaborated with a trauma centre ED to look at this issue and did an audit of soft collar-related incidents and discomfort. This found that the soft-collar was less likely to result in patient discomfort or iatrogenic injuries. We also worked with the radiology department to develop and implement a process whereby patients are approved for a c-spine scan, while they are fitted with a soft collar.

Following this, we switched from using hard collars to soft collars (Philadelphia collar or sponge ring) in the ED – an initiative backed up by the recent audit.

These changes improved the trauma care delivered in the ED, as well as reducing both patient discomfort and the numbers of iatrogenic injuries. It also improved overall patient satisfaction.

There were positive outcomes from the ED's collaboration with the trauma ED and the radiology department.

The better awareness of how to manage neck trauma improved, as did the process of clearing these patients for discharge.

Improving awareness of patient safety principles in the ED

There was a need to improve awareness of patient safety principles in the ED. The understanding of these principles was patchy, leading to a failure to address significant contributory factors in adverse events analyses.

We provided more education for staff in the following ways:

- ▶ ED staff completed Patient Safety (HEAPS) and Root Cause Analysis (RCA) training.
- ▶ Topics such as human factors, cognitive bias, speaking up, and safe team behaviours were included in trainee and nursing education.
- ▶ Clear descriptions of contributory factors and relevant cognitive biases were included in all multidisciplinary Mortality and Morbidity presentations.
- ▶ Initiation of Learning from Cases education sessions, with a focus on human factors.
- ▶ Introduction of 'amazing and awesome' cases into the Mortality and Morbidity meetings, focusing on what team and situational factors contributed to optimal patient outcomes.

The impact of this was:

- ▶ Greater awareness of human factors and cognitive biases, and their impact on patient diagnoses, care and outcomes.
- ▶ Better identification of associated contributory factors in adverse events analysis, with the development of stronger recommendations to prevent the same things happening again.
- ▶ Elimination of individual blame for when things go wrong – staff are now able to view errors through a complex system lens.
- ▶ Greater engagement in clinical incident analyses and finding solutions to problems.

We learned from this process that:

- ▶ Staff are eager to learn new skills and willing to implement them, especially when they can identify with their own human factors and biases.
- ▶ A multidisciplinary approach to identifying contributory factors and developing recommendations after adverse events delivers a richer analysis and understanding of why things go wrong, along with stronger and more effective practice change.

- The ED team focuses on allowing equitable access to training and educational opportunities for students, junior team members and trainees within the ED.
- The ED team or ED network has the capacity to provide appropriately qualified senior staff to support training and education.
- The ED team supports the teaching and assessment of clinical students in the ED.

Intent

The ED team supports clinical students, junior team members and trainees to develop their knowledge and skills, and to work within the limits of their competence and scope of practice with appropriate levels of supervision.

Improving awareness of patient safety principles in the ED

There was a need to improve awareness of patient safety principles in the ED. The understanding of these principles was patchy, leading to a failure to address significant contributory factors in adverse events analyses.

We provided more education for staff in the following ways:

- ▶ ED staff completed Patient Safety (HEAPS) and Root Cause Analysis (RCA) training.
- ▶ Topics such as human factors, cognitive bias, speaking up, and safe team behaviours were included in trainee and nursing education.
- ▶ Clear descriptions of contributory factors and relevant cognitive biases were included in all multidisciplinary Mortality and Morbidity presentations.
- ▶ Initiation of Learning from Cases education sessions, with a focus on human factors.
- ▶ Introduction of 'amazing and awesome' cases into the Mortality and Morbidity meetings, focusing on what team and situational factors contributed to optimal patient outcomes.

The impact of this was:

- ▶ Greater awareness of human factors and cognitive biases, and their impact on patient diagnoses, care and outcomes.
- ▶ Better identification of associated contributory factors in adverse events analysis, with the development of stronger recommendations to prevent the same things happening again.
- ▶ Elimination of individual blame for when things go wrong – staff are now able to view errors through a complex system lens.
- ▶ Greater engagement in clinical incident analyses and finding solutions to problems.

We learned from this process that:

- ▶ Staff are eager to learn new skills and willing to implement them, especially when they can identify with their own human factors and biases.
- ▶ A multidisciplinary approach to identifying contributory factors and developing recommendations after adverse events delivers a richer analysis and understanding of why things go wrong, along with stronger and more effective practice change.

The ED team/network has the capacity to provide appropriately qualified senior staff to provide appropriate supervision of trainees, students and junior team members to ensure high-quality care is provided to patients.

- Appropriate supervision is provided at all times to students, junior team members and trainees.
- Students, junior team members and trainees within the ED are exposed to a wide spectrum of emergency presentations.
- Clinical students in the ED are easily identified and receive tailored support and supervision.
- The ED team ensures that the role of training students, junior team members and trainees does not compromise the clinical service provision role of the ED.
- The ED roster allows direct supervision of junior medical staff and trainees by a senior medical practitioner experienced in emergency medicine and junior nursing staff by a senior emergency nurse.
- The ED team welcomes and assists students, junior team members and trainees as required, providing confidence in shared and cooperative knowledge within the ED team.

Intent

The ED team supports clinical students, junior team members and trainees to develop their knowledge and skills, and to work within the limits of their competence and scope of practice with appropriate levels of supervision.

- The ED team or ED network looks to provide support to universities and colleges in the local area, for the purpose of continual education and community outreach.
- The ED team or ED network forms collaborative relationships with higher education providers to further specialist education at the postgraduate level.
- The ED team or ED network engages other healthcare craft groups in collaborative joint education sessions for staff in patient care for the whole patient journey.

Intent

The ED team supports clinical students, junior team members and trainees to develop their knowledge and skills, and to work within the limits of their competence and scope of practice with appropriate levels of supervision.

Improving awareness of patient safety principles in the ED

There was a need to improve awareness of patient safety principles in the ED. The understanding of these principles was patchy, leading to a failure to address significant contributory factors in adverse events analyses.

We provided more education for staff in the following ways:

- ▶ ED staff completed Patient Safety (HEAPS) and Root Cause Analysis (RCA) training.
- ▶ Topics such as human factors, cognitive bias, speaking up, and safe team behaviours were included in trainee and nursing education.
- ▶ Clear descriptions of contributory factors and relevant cognitive biases were included in all multidisciplinary Mortality and Morbidity presentations.
- ▶ Initiation of Learning from Cases education sessions, with a focus on human factors.
- ▶ Introduction of 'amazing and awesome' cases into the Mortality and Morbidity meetings, focusing on what team and situational factors contributed to optimal patient outcomes.

The impact of this was:

- ▶ Greater awareness of human factors and cognitive biases, and their impact on patient diagnoses, care and outcomes.
- ▶ Better identification of associated contributory factors in adverse events analysis, with the development of stronger recommendations to prevent the same things happening again.
- ▶ Elimination of individual blame for when things go wrong – staff are now able to view errors through a complex system lens.
- ▶ Greater engagement in clinical incident analyses and finding solutions to problems.

We learned from this process that:

- ▶ Staff are eager to learn new skills and willing to implement them, especially when they can identify with their own human factors and biases.
- ▶ A multidisciplinary approach to identifying contributory factors and developing recommendations after adverse events delivers a richer analysis and understanding of why things go wrong, along with stronger and more effective practice change.

- The ED team members involved in supervision and training receive training in the provision of clinical education, supervision, and other educational processes.
- The ED team ensures that team members involved in training and education receive regular feedback about their performance.
- The ED team is supported to engage in the education of others.

Intent

The ED team ensures that clinicians and professionals participate in continuing professional development, peer review and reflection on practice, to maintain and improve knowledge and skills relevant to their clinical work, and to ensure compliance with relevant regulating bodies.

Domain 5 / Research

Intent ▶ The research domain covers the development and implementation of high-quality, contemporary and evidence-based clinical care.

Research is conducted within the ED as required to address clinical uncertainties and drive optimal patient outcomes, complying with ethical guidelines and good clinical practice guidelines.

Patient and staff participation and collaboration in research quality improvement is encouraged.

The ED team has processes to systematically review and implement relevant research findings and evidence-based practice.

The ED team participates in continuous quality improvement to improve the delivery of clinical care.

Research to be conducted in the ED is planned and scoped to ensure it is relevant and that any negative impact on the clinical activity occurring within the department is weighed against the potential benefits of the research to the profession and broader community.

- The ED team participates in planning for research being conducted in the ED.
- The ED team considers proposed research in the context of the ED environment to ensure patient-centred care is maintained.
- The ED team maintains research integrity principles when planning research for the ED.
- The ED team ensures there is transparency in the conduct of research in the ED.
- The ED team ensures any research being undertaken is culturally safe.
- The ED team ensures that research planned adheres to the mutual responsibilities between investigators and their research participants.

Intent

Research conducted within the ED or with patients of the ED has appropriate approval from ethics committees, and methods reflect reliable research methodology. Research involving critically ill patients is supported. Culturally safe research processes and methodologies are promoted.

Patient participation and consent is sought through discussion about both the benefits and the risks of medical research.

- The ED team ensures there is an effective process for obtaining consent for participants including when, how and by whom it is obtained.
- Consent for research in the ED is undertaken according to approval by the human research ethics committee.
- The ED team ensures that research is designed so that each participant's consent or process of obtaining consent is clearly established and documented.
- The ED team ensures that absolute care and respect is exercised in obtaining consent from participants or a suitable proxy decision maker.
- The process of obtaining waiver of consent for critically ill patients is conducted and documented according to pre-agreed protocols.

Intent

Research conducted within the ED or with patients of the ED has appropriate approval from ethics committees, and methods reflect reliable research methodology. Research involving critically ill patients is supported. Culturally safe research processes and methodologies are promoted.

Patients are given the opportunity to participate in research and are informed that their decision to participate is voluntary and will not affect any treatment or care received.

Critically ill and injured patients have a right to participate in clinical research to improve the evidence base for high-quality emergency medical care.

- The ED team ensures the correct use of patient information statements, with particular regard for levels of health literacy and language, when communicating with patients to participate in research.
- The ED team ensures that researchers, clinicians, and ED team members work in partnership to enable patients to participate in research if desired.
- The ED team ensures any potential participants have the opportunity to refuse participation in the research project and are not required to give any reason or justification for their decision.
- The ED team ensures any participants have the opportunity to discontinue participation in the research project and are not required to give any reason or justification for their decision.
- The ED team acknowledges the participation of the patient, their family or carer in the research process.
- The ED team ensures the correct consenting process is followed for patients who are unable to give informed consent at the time of commencing the research process.
- The ED team ensures that individual patient care takes precedence over patient participation in research or educational endeavours.
- The ED team ensures that the requirements of quality, research and educational activities are considerate of participants' time and effort.

Intent

Patients and team members of the ED have the opportunity to be informed of research opportunities and participate where desired.

Members of the ED team are encouraged to participate in research and are informed that their decision to participate is voluntary and will not affect their involvement or position.

- The ED team is encouraged to participate in relevant and approved research in their department.
- The ED team ensures the correct use of information statements when communicating with team members regarding participation in research.
- The ED team has the opportunity to participate in relevant research activities within or impacting upon the ED.
- ED team members have the opportunity to decline individual participation in research.

Intent

Patients and team members of the ED have the opportunity to be informed of research opportunities and participate where desired.

- All members of the ED team are encouraged and empowered to participate in or contribute to quality improvement.
- Training and resources are provided to the ED team to conduct quality improvement.
- Patient involvement in quality improvement processes is encouraged and supported.

Intent

The ED participates in a formal and systematic approach to quality improvement to improve the delivery of care. All team members are recognised as possessing critical knowledge about workflow and organisational processes and are empowered by the organisation to develop solutions for the problems they encounter.

Regional, rural and remote resources

This section contains resources specific to regional, rural and/or remote (RRR) settings.

Quality improvement scenarios

The quality improvement scenarios provided have been created to assist users with considering and navigating how the Standards may apply to particular patient groups, workforce issues and/or other ED systems and processes.

These scenarios are intended to be illustrative of how the Standards could be relevant to a particular situation.

These scenarios outline a situation where a patient safety, workforce safety and/or other quality issue has arisen, and the ED team and/or quality improvement team are now reviewing what has happened.

The key standards and objectives are not definitive of every single one that could possibly apply to the situation, but has been provided to indicate where reflective quality improvement processes may be best focused in this type of scenario.

✉ If you would like to provide your own example of a quality improvement scenario for inclusion in the **Quality Standards Toolkit**, that is relevant for RRR health professionals, please email policy@acem.org.au

Regional, rural and remote emergency medicine – digital learning resource

This mini digital learning resources in this course are designed to progress the knowledge and skills of trainees, ACEM members and other health professionals for the practice of RRR emergency medicine in Australia and Aotearoa New Zealand.

[Click here](#) ↗

If you are a health professional who is not an ACEM member, please email policy@acem.org.au to obtain a login to ACEM's Educational Resources portal.

Better mental health care in rural EDs

The Mental Health in Rural Emergency Department (MHR-ED) project is a purpose-built website that will provides health professionals in rural areas with guidelines, articles, tools and resources to assist staff providing emergency care in RRR areas with increasing their competence and confidence with assessing and managing patients who present with mental health issues. This site aligns with the broader Quality Standards and link to a number of relevant mental health guidelines and initiatives within the College.

Minimum standards for small rural hospital EDs

The Australian College of Rural and Remote Medicine (ACRRM) has developed a resource outlining Recommended minimum standards for small rural hospital EDs.

Please [click here](#) ↗ to access this document.

Scenario / Improving patient experience and workforce experience with RRR scenario

[Back to scenarios index](#)

Scenario

Key standards and objectives

Step 1

A small rural ED undertook a review of the handover of critically unwell patients – that is critical patients with complex diagnoses and/or a number of differential diagnoses.

The ED identified that a number of instances of delays in transfer, resulting from rostering issues.

Following stabilisation of a critical patient, the senior ED medical doctor on shift finished their shift, as they were rostered on for the next day.

A call was then placed to the ambulance retrieval service requesting transfer. However, as the senior doctor involved had now left, a full description of the patient and their transfer needs was not able to be provided to the ambulance service.

This confusion caused a significant amount of stress for all staff involved, and ultimately resulted in decision-making delays and the subsequent transfer of the patient to a larger hospital.

Step 2

The ED had ISBAR protocols in place, however there was no defined protocols for who should be coordinating the communications and transfers of these critical patients.

Following collaboration with the ambulance service, a transfer process was designed and implemented requiring the senior doctor involved in stabilising the patient, to contact the ambulance service and receiving hospital's ICU to arrange a patient transfer.

Step 3

In addition, the rostering process was also revised to ensure that the senior and/or on-call doctor involved in stabilising a critical patient and organising their transfer, was not rostered on immediately afterwards the following day.

Scenario / Improving patient experience for mental health patients with RRR scenario

Scenario

Key standards and objectives

Step 1

In a rural ED (with a small mental health inpatient unit), a patient presents in the evening with a mental health crisis, voluntarily. The patient has a history of mental health issues, and also presents drug affected, requiring chemical restraint.

After-hours the hospital only has access to a mental health triage via telehealth. It is agreed that given the patient's history and escalating behaviour, the patient requires admission, however there are no inpatient beds. The patient therefore requires transfer to another hospital.

Local protocols determine that unless the patient is an involuntary patient, ambulance transfer is not possible.

The patient was taken to a Behavioural Assessment Room (BAR) – however this is not in direct eyesight of the nurse-in-charge. The BAR has a door that automatically locks.

Throughout the evening the patient's behaviour escalates, requiring a security response, and eventual sedation. The patient is now an involuntary patient and is eventually transferred to a bigger regional hospital with a larger mental health inpatient unit.

Step 2

The ED team undertook a review of the following:

- ▶ The process for assessing mental health patients.
- ▶ The use of the BAR and the monitoring of patients if the door is locked.
- ▶ Medication guidelines.

New guidelines were developed and implemented to reflect the importance of patient agreement in the use of the BAR. Patients in the BAR were to also be continuously observed.

Step 3

The ED also determined to review its escalation policies and ambulance transfer policies, with a view to ensuring that voluntary mental health patients were able to be transferred to a therapeutic environment, whilst waiting for an inpatient bed.

Scenario / Improving patient experience with RRR scenario

Scenario

Key standards and objectives

Step 1

In a rural ED, a situation has arisen in the application of local hospital clinical protocols by locum staff. The ED has a HDU but no ICU, so all critical care patients are transported to another ED (with ICU), once they are stabilised.

Due to regular medical staffing shortages, the ED relies heavily on locum doctors and/or visiting medical officers (VMOs).

A patient presents to the ED and requires intubation. The locum anaesthetist requests that the patient is taken to an operating theatre for intubation, and that theatre staff are called in.

The local hospital protocol is that the patient can be intubated in the ED by the senior ED doctor on shift.

Transferring an unstable patient could cause the patient significant stress.

Step 2

Following this incident, a review of the hospital's resuscitation protocol was commenced.

Participating ED staff collaborated with the hospital's anaesthetics department and local GPs, VMOs and locum anaesthetists.

An airway management checklist was developed, outlining all relevant steps, medications to use, and appointment of defined roles within the resuscitation team.

A hospital protocol was established that outlined all critical care patients requiring intubation were to be intubated in the ED.

Step 3

This checklist was then distributed to any doctor who may be involved in emergent airway management.

In addition, multidisciplinary simulation training sessions we implemented.

These sessions involved nurses, local GPs who work in the ED and hospital and VMO anaesthetists.

Scenario

Key standards and objectives

Step 1

In a rural ED, an issue has been identified regarding the application of consistent MET call criteria.

Due to regular medical staffing shortages, the ED relies heavily on locum doctors and/or visiting VMOs.

It was identified that occasionally, there were alterations to MET call criteria signed-off by a senior clinician.

For example patient with worsening abdominal pain was given fluids and the MET call criteria adjusted, instead of investigation of the underlying pathology of the abdominal pain.

Step 2

The process for making adjustments to MET call criteria was reviewed.

This resulted in a revised more robust process, requiring the provision of increased information to clinically justify the adjustment.

Short information and training sessions were provided to ED staff to promulgate this information.

Scenario / Reviewing your ED's needs in preparation for the holiday/tourist season

This scenario provides an overview of a holiday makers journey through a small regional or rural ED, and how the Quality Standards would apply to each stage of this journey.

Holiday makers double the town population during tourist season. Many injure themselves and present to hospital-based emergency facility. Some will be treated locally, and some will need to be referred elsewhere for investigation and treatment

Scenario	Key standards and objectives
<p>Step 1</p> <p>It is likely that the holiday maker's GP will be located in another town or city and not be known to the hospital.</p> <p>Mechanisms will therefore need to be in place for the GP to be informed about the outcome of the patient's emergency visit.</p> <p>Most tourists will also be new patients to the hospital. The ED team should therefore ensure that each page of these new patient files is identified with the patient's unique identifier and name.</p> <p>⌵</p>	<p>Domain 1 1.1A 1.1B 1.1C</p> <p>Domain 2 2.6D</p>
<p>Step 2</p> <p>It is likely that calls for advice will be received from patients and family members unfamiliar with local emergency resources.</p> <p>Advice should be given in line with ACEM advice policies.</p> <p>⌵</p>	<p>Domain 1 1.2A 1.2B 1.2C</p>
<p>Step 3</p> <p>A large increase in patient numbers will result in patients waiting to be seen.</p> <p>The triage area should be clearly signposted.</p> <p>Patients should be triaged according to the ATS.</p> <p>Staff need to collect enough demographic information to identify and follow up the patient without impeding provision of timely care. Patients need to be informed about waiting times and regularly reassessed for deterioration.</p> <p>⌵</p>	<p>Domain 1 1.3A 1.3B 1.3C</p> <p>Domain 2 2.1A 2.1B 2.3A 2.3B 2.3C 2.3D</p>

Scenario / Reviewing your ED's needs in preparation for the holiday/tourist season

[Back to scenarios index](#)

Scenario	Key standards and objectives
<p>Step 4</p> <p>Vital signs should be recorded as soon as practicable.</p> <p>Spaces must be available to maintain a patient's privacy, dignity and safety throughout the examination.</p> <p>Relevant point of care testing should available if possible. Team members together develop a patient's working diagnosis and differential diagnosis.</p> <p>The patient should be informed of the working diagnosis, and informed that a definitive diagnosis may not be reached during the visit to this ED due to limited investigations.</p> <p>⌵</p>	<p>Domain 1 1.4A 1.4B 1.4C 1.4D 1.4E 1.4F</p> <p>Domain 2 2.1A 2.1B 2.1G</p>
<p>Step 5</p> <p>Senior staff should be involved with critically ill patients as soon is possible.</p> <p>A mechanism should exist to receive advice from FACEMs and other relevant specialists from the regional health network.</p> <p>The ED team needs to be familiar with local policies relating to high-risk clinical conditions. Standard pathways should be used to reduce unwarranted variation in care.</p> <p>⌵</p>	<p>Domain 1 1.5A 1.5B 1.5C 1.5D 1.5E</p> <p>Domain 2 2.4A 2.6C 2.7A 2.7D</p> <p>Domain 3 3.1A</p>
<p>Step 6</p> <p>The ED team should ensure medications are safely stored, prescribed and administered.</p> <p>Mechanisms must be in place to keep patients fed and hydrated during long stays.</p> <p>The ED needs protocols to manage behavioural disturbance.</p> <p>The ED needs protocols in place to identify patient deterioration. The department should document any contraindications to procedural sedation at this location.</p> <p>⌵</p>	<p>Domain 1 1.6A 1.6B 1.6C 1.6D 1.6E 1.6F 1.6G 1.6H 1.6I 1.6J 1.6K 1.6L 1.6M 1.6N</p> <p>Domain 2 2.8A 2.8B 2.8C 2.8D 2.8E</p> <p>Domain 3 3.2A 3.2B 3.2C 3.2D 3.2E</p>

Scenario / Reviewing your ED's needs in preparation for the holiday/tourist season

Scenario

Key standards and objectives

Step 7

Many patients with injuries will need transfer to another facility for investigation and treatment.

The ED team and hospital need clear agreements for referral and transfer to another hospital. The ED team should ensure the patient is informed about reasons, risks, and benefits of transfer to another hospital or healthcare facility.

The ED team needs protocols in place with pre-hospital and retrieval services to ensure suitable transport options are available.

The ED team should be trained in preparing patients for transport. The ED team must ensure that referral documentation contains sufficient information to facilitate ongoing care and that the patient is accompanied by all relevant patient history and treatment records.

For discharged patients, the ED should document discharge and follow-up plans. Any post-discharge instructions for patients should be provided when needed.

1.7J

1.7K

1.7L

1.7M

Step 8

The ED team should participate in a collaborative hospital network which supports the secure use of telemedicine and provides the specialist expertise required.

Where telemedicine is used, the ED team need to be adequately resourced, have access to functional equipment and be trained and supported in its use.

Domain 1

1.10A

1.10B

Step 9

Tourists may be unfamiliar with the local hospital layout.

The ED must be clearly identified and easily accessed by anyone. The ED should be located in a part of the hospital easily accessible from the outside, by pedestrians or vehicles.

The ED needs a mechanism for safe placement of behaviourally disturbed patients, separate from other patients.

Scenario / Reviewing your ED's needs in preparation for the holiday/tourist season

Scenario	Key standards and objectives
<p>Step 10</p> <p>The ED team shall ensure that all staff members, including locum and/or visiting staff members, are trained in the use of new or replacement equipment used in the ED and if required credentialed in its use.</p> <p>⌵</p>	<p>Domain 2 (2.2A, 2.2B, 2.2C, 2.2D, 2.2E)</p> <p>Domain 4 (4.1A, 4.2C)</p>
<p>Step 11</p> <p>The ED team must ensure a range of clinical and nonclinical staff to match the department's needs – taking into account the likely increased use of locum and/or VMO staff – and how the combination of longer-term staff with visiting staff is likely to impact on patient flow and the ED's workload.</p> <p>⌵</p>	<p>Domain 2 (2.4A, 2.4B, 2.4C, 2.4D)</p>
<p>Step 12</p> <p>Small rural EDs may not have onsite security. The ED team should advocate for measures to ensure that the ED is a safe and secure environment for team members.</p> <p>⌵</p>	<p>Domain 2 (2.5A, 2.5B, 2.5C, 2.5D)</p>
<p>Step 13</p> <p>Many small rural towns are prone to natural disasters. The ED needs a disaster management plan to direct, control and coordinate response and recovery situations</p> <p>⌵</p>	<p>Domain 2 (2.9A, 2.9B, 2.9C)</p>
<p>Step 14</p> <p>The ED team may notice an increased prevalence of particular injuries.</p> <p>The ED should use this knowledge to participate in public health awareness and advocacy, illness prevention and preventive care based on patient need and best available evidence.</p> <p>⌵</p>	<p>Domain 3 (3.3A)</p>
<p>Step 15</p> <p>Members of the ED team should receive orientation, induction, and support in the initial period of employment at the ED.</p> <p>Processes and systems to facilitate this should consider the increased use of casual and locum staff, and therefore how these activities can be delivered most effectively.</p>	<p>Domain 4 (4.1A, 4.1B, 4.1C, 4.1D, 4.1E, 4.1F, 4.1G)</p>

Quality improvement areas

Quality improvement scenarios

The quality improvement scenarios provided have been created to assist users with considering and navigating how the Standards may apply to particular patient groups, workforce issues and/or other ED systems and processes.

These scenarios are intended to be illustrative of how the Quality Standards could be relevant to a particular situation.

These scenario outline a situation where a patient safety, workforce safety and/or other quality issue has arisen, and the ED team and/or quality improvement team are now reviewing what has happened.

The key standards and objectives are not definitive of every single one that could possibly apply to the situation, but have been provided to indicate where reflective quality improvement processes may be best focused in this type of scenario.

 If you would like to provide your own example of a quality improvement scenario for inclusion in the **Quality Standards Toolkit** please email policy@acem.org.au

Step 3

After 22 hours, during the night, the patient suddenly deteriorates requiring the need for intubation. The new ED doctor is unsure how to use the video-laryngoscope when no image appears on the screen and requires three attempts to intubate the patient. There are no ICU beds available at the hospital and transfer to another facility is required.

Scenario

Key standards and objectives

Step 1

A 79 year old man presents to your ED with abdominal pain and distension, nausea and anorexia. He underwent a total colectomy and loop ileostomy for colorectal cancer at your hospital seven days ago. He is also complaining of tenderness around the ileostomy site.

His vital signs are:

Temp: 37.8°C	HR: 105/min
BP: 145/90 mmHg	RR: 20/min
SaO2: 95% on air	

Domain 1

Scenario / Improving education and improving workforce experience

[Back to scenarios index](#)

Scenario

Key standards and objectives

Step 1

The DEMENT has noticed that a number of registrars are regularly not able to attend formal education and training teaching sessions.

The DEMENT and DEM undertake the following:

- ▶ Review formal teaching session attendance records.
- ▶ Review the ED roster as to availability of senior staff and/or senior decision-makers.
- ▶ Review rostering of trainees, how many trainees are rostered onto each shift, how many senior decision-makers are on the floor.
- ▶ Review of how teaching time is incorporated into trainee rosters.
- ▶ Review of service needs and how this intersects with trainee teaching time.
- ▶ Are there other inadequacies in rostering that cause trainees to give up their teaching time i.e. rosters are rostering on too many trainees at once, and then that impacts on-the-floor service provision?
- ▶ How are teaching sessions structured?
- ▶ Review of the curriculum and topics covered to ensure it is meeting needs of different stages of training.
- ▶ A review of the resources utilised e.g. teaching space, internet access, other technology requirements etc.

A meeting is also held with the FACEM trainees to discuss the situation.

Scenario

Key standards and objectives

Step 2

Following consultation with trainees and an exploration of the barriers to increased education session attendance, the DEMT also reviews:

- ▶ Relevant College accreditation policies and professional practice standards. ACEM policies and standards.
- ▶ Relevant industrial standards.
- ▶ Guidance from post-graduate training organisations.

Step 3

The DEMT and DEM identify that the roster mix and the priority education needs of the trainees require a revised approach to trainee teaching sessions.

Working with the trainee representative, they develop a business case to:

- ▶ Employ an additional one FTE FACEM or non-FACEM senior decision-maker to assist with meeting service requirements when trainees are required to attend education sessions.
- ▶ A new rostering process to better incorporate trainee teaching sessions.
- ▶ Recording teaching sessions for those unable to attend.
- ▶ Remuneration for trainees to attend teaching.
- ▶ Establish a teaching network with a nearby hospital so as to share the load.
- ▶ Develop and introduce a 12 month formal educational curriculum based on the ACEM Fellowship examination. Trainees have identified that teaching and education sessions leading towards the Fellowship examination is what is needed most.

Scenario / Improving workforce experience

[Back to scenarios index](#)

Scenario

Key standards and objectives

Step 1

The DEM has received feedback regarding issues with the ED medical staffing roster. A number of in-charge consultants have provided feedback that for particular shifts, there has been a mismatch in the skill sets available e.g. higher numbers of interns required, with no and/or limited registrars/FACEM trainees.

The DEM undertakes an audit of the last two months of ED medical staffing rosters, using payroll records and the electronic medical records for those shifts.

Domain 2

2.5B

2.5C

2.7A

2.7B

2.8C

Domain 3

3.1A

3.1B

3.3B

Step 2

To address the issue the DEM undertakes further consultation with the ED medical staff, reviews relevant ACEM workforce standards, jurisdictional policies and guidelines, industrial information and workforce planning tools.

The DEM considers the broader ED workforce rostered on for each clinical shift including nursing staff, allied health staff and administrative staff, and how staffing numbers across these areas for each shift will impact the clinical care capacity of medical staff on each roster.

The DEM also consults with staff from other departments including the Human Resources department, hospital executive and union representatives.

Scenario

Key standards and objectives

Step 3

The DEM determines that a business case is required to address two key issues:

- 1 Establishing a robust process for staff wanting to swap shifts. Consultation with staff has identified that no standard process for swapping shifts is applied, leading to shifts that whilst initially are developed to meet the right skill-mix for each shift, have resulted in ad-hoc rosters that are not meeting the service needs for shifts. current process for swapping shifts is.
- 2 Ensuring a sustainable workforce for the ED. The audit of rosters has also identified a consistent short-fall in senior decision-makers (FACEM or non-FACEM), and due to consistently increasing presentations, additional staffing is required in order to ensure continued patient safety and to avoid staff burnout.
